S.S. White
Flexible Shafts
Eliminate
Unnecessary
Parts

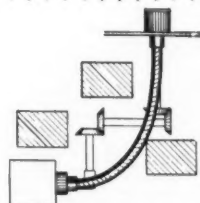

One manufacturer used flexible shafts to replace 35 parts in a Hydraulic Power System . . . cut costs by 90%. Four flexible shafts replaced a 35-part remote-control system . . . simplified design . . . made assembly easier . . . eliminated alignment problems . . . improved performance!

This is only one of hundreds of remote control and power drive problems these quality

flexible shafts are solving in every industry today. Can S.S. White flexible shafts help improve *your* product? Perhaps make it lighter in weight . . . cut production costs . . . eliminate unnecessary parts?

If you'd like to know more about flexible shafts, the advice of our engineers costs you nothing. Just write to

S. S. White Industrial Division, Dept. 4, 10 East 40th Street, New York 16, N. Y.
Western Office: 1839 West Pico Blvd., Los Angeles 6, Calif.

GIP-Specified

Typical "Light Latch" Gasket
Cross Sections

What can you learn from the "Light Latch" Gasket Story?

Here was a problem facing the entire appliance industry—how to prevent the tragedy of curious children becoming entrapped in idle refrigerators.

The solution lay in designing a door that could be easily pushed open from the inside. Though low pressure latches were available, they wouldn't work against the husky vinyl gaskets then being turned out. A gasket was needed that would seal the full perimeter of the door under a fraction of the former pressure, as well as lasting the life of the machine.

Finally a leading manufacturer turned the problem over to the G.T.M.—Goodyear Tech-

nical Man. Immediately a corps of designers and compounders set to work and, in surprisingly short time, had the answer. Result: Most of the leading refrigerator manufacturers buy their "light latch" gaskets—designed and compounded to their own particular needs—from Goodyear.

The moral of the story: For complete product design, expert mold and custom compounding, backed by the facilities and people to turn out quantities of quality molded or extruded plastic parts on "spec" and on time, see the G.T.M. or write Goodyear, Industrial Products Division, St. Marys, Ohio, Los Angeles 54, California, or Akron 16, Ohio.

24% savings in finishing costs and better forming with **Formbrite**

FINE DESIGN and a rich luster finish are the main sales features of the quality brassware manufactured by Coronet Brass, Incorporated, New York City.

Coronet's finishing operations, therefore, are of primary importance. Hearing about the outstanding polishing characteristics of Formbrite®, Anaconda's superfine-grain drawing brass, the company placed a trial order. The planter, jardiniere, and "leather-on-brass" waste basket shown above were among the first products made of Formbrite.

After several months of operation, Mr. Maurice Schulman, owner of Coronet Brass, summarized the company's experience with Formbrite as follows:

1. "We estimate that there is a saving of approximately 24% in our initial cutting operation, which represents about three-quarters of the complete finishing operation for our brassware.

2. "We further estimate that there is an approximately 20% difference in the color-buffing operation—the final step before the brass is lacquered.

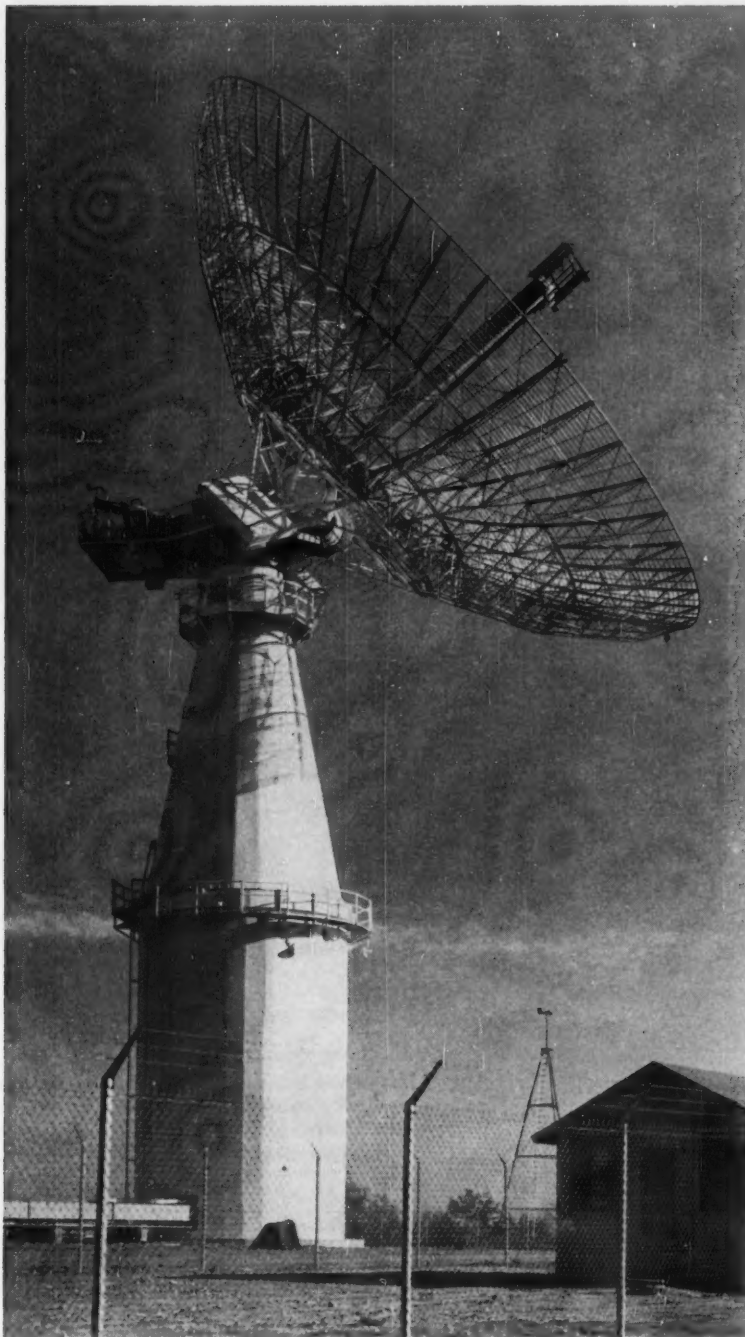

3. "We have found that, on a small beading operation performed on one of our items, there is a time saving of about 50% due to the fact that Formbrite does not wrinkle as does regular brass in our automatic beading machine. The operation used to call for extreme vigilance, wasted much time. Now this substantial saving is possible because of Formbrite's springiness."

Formbrite
Superfine-grain drawing brass
an **ANACONDA**® product
made by
The American Brass Company

Find out for yourself. Formbrite is a premium product, yet it doesn't cost a penny more than ordinary drawing brass. Try it and see for yourself how its superfine grain, excellent drawing properties, strength, and scratch resistance can help you cut costs and make a better product. Get a sample or a trial batch. See your American Brass representative or write: The American Brass Company, Waterbury 20, Conn. In Canada: Anaconda American Brass Ltd., New Toronto, Ont., Canada.

Engineering News Roundup

Sputnik and Muttnik Passes Seen Here

**Huge Radar Pinpoints
Satellite Positions**

LEXINGTON, MASS. — A powerful, long-range radar has been detecting the Russian satellites, Sputniks I and II, at remote distances from Millstone Hill in Westford, Mass. Completion of the high-powered radar was made public by Lincoln Laboratory of the Massachusetts Institute of Technology only after it had been used to observe the satellites. Partly as a result of radar sightings, the orbit characteristics of the Sputnik satellites have been determined with considerable accuracy.

From observations of Sputnik II, measurements of range, elevation, bearing, and Doppler frequency were made. Height of Sputnik II, when first observed, was 152 mi.

Designed primarily for the study of problems in missile defense, the Millstone radar will provide valuable information on the operation and applications of high-power, long range radar; also assist research of the radio effects of meteors and the aurora. Designed especially for the radar and its associated equipment is a transistorized digital computer, as well as high-power klystron tubes, 11 ft high, that provide the transmitting power.

The antenna system consists of a parabolic reflector, 84 ft in diam, mounted on a tower 90 ft high. The rotating portion weighs 90 tons. Antenna can sweep sky with horizontal rotation of 360 deg, vertical elevation of 90 deg.

Minute bending of the antenna tower caused by uneven heating by the sun was outside tolerance. Bending was minimized by painting to the strength and rigidity of

Tender for Offshore Drilling Is Self-Contained Operation

Up-To-Date Ship Is Offshore Workhorse

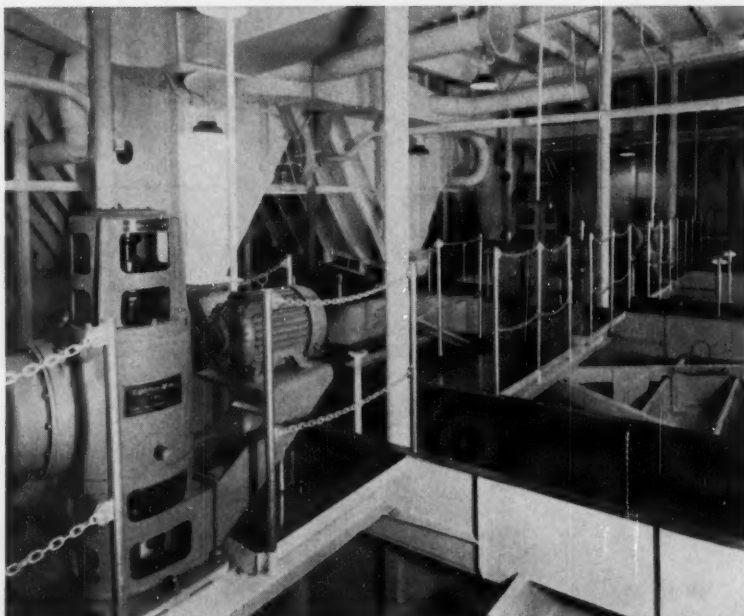

BEAUMONT, TEX.—A new tender for offshore drilling platforms boasts seaworthiness of a conventional ship as well as a helicopter deck, electrical and machine shops, air conditioned living quarters for 58, and a large revolving crane. Built by the New York Shipbuilding Corp., the *Howard S. Cole Jr.* has recently been commissioned by the Coastal Marine Drilling and Construction Corp.

Target for design was a completely self-contained tender, providing its own propulsion power. The new ship is capable of transporting and storing drilling mud, cement, drill pipe, and fresh water.

The Texas deck of the after superstructure forms a 56 by 60 ft helicopter deck complete with safety net and is lighted in accordance with CAA requirements.

Mounted on the main deck forward is a large revolving crane, equipped with air controls. Through the use of a specially designed swing motor and control system, the crane is capable of swinging in a 6-deg uphill or downhill list condition.

The crane has adequate capacity to erect the drilling platform

Aboard offshore drilling platform tender, four heavy duty agitators mounted in the mud tanks provide the means of building up mud weight quickly in an emergency. Tender storage capacities are 5000 sacks of bulk mud, 1800 barrels of liquid mud, 2500 sacks of bulk cement, 12,500 barrels of drilling water, and 500 barrels of drinking water.

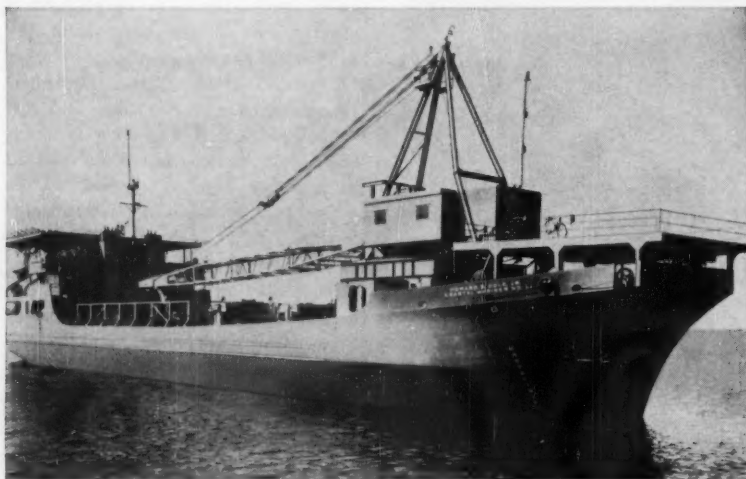

foundation, drive the necessary piling to anchor it, and to erect the drilling structure and heavy drilling machinery. The crane is used also to handle casing, mud, cement, drill pipe, and supplies necessary in the support of an offshore drilling operation.

Magnetic Flux Turns Corners With Ease in New Metal

Silicon Iron Crystallinity Permits Right-Angle Paths

PITTSBURGH—Crystal arrangement in a new magnetic steel permits metal to be magnetized along either of two axes. According to Westinghouse engineers, this permits magnetic flux to "turn corners" readily.

Conventional steel now used in magnetic cores is singly oriented. It can be easily magnetized along one axis only, the direction of steel

Of all-welded construction, offshore drilling platform tender is 272 ft long with a beam of 56 ft and is 22 ft deep. Tender has main deck and one complete lower deck, a raked stem and modified cruiser stern.

Front Cover

"The little gear who wasn't there" might be the subject of artist George Farnsworth's front cover. Faced with the problem of typifying stamped gears, George decided to skip the gear entirely and concentrate on what's left after the gears are blanked out. You'll find the gears themselves on Page 161.

HIGH-SPEED
FEED TABLE
DRIVE AND
CONTROL

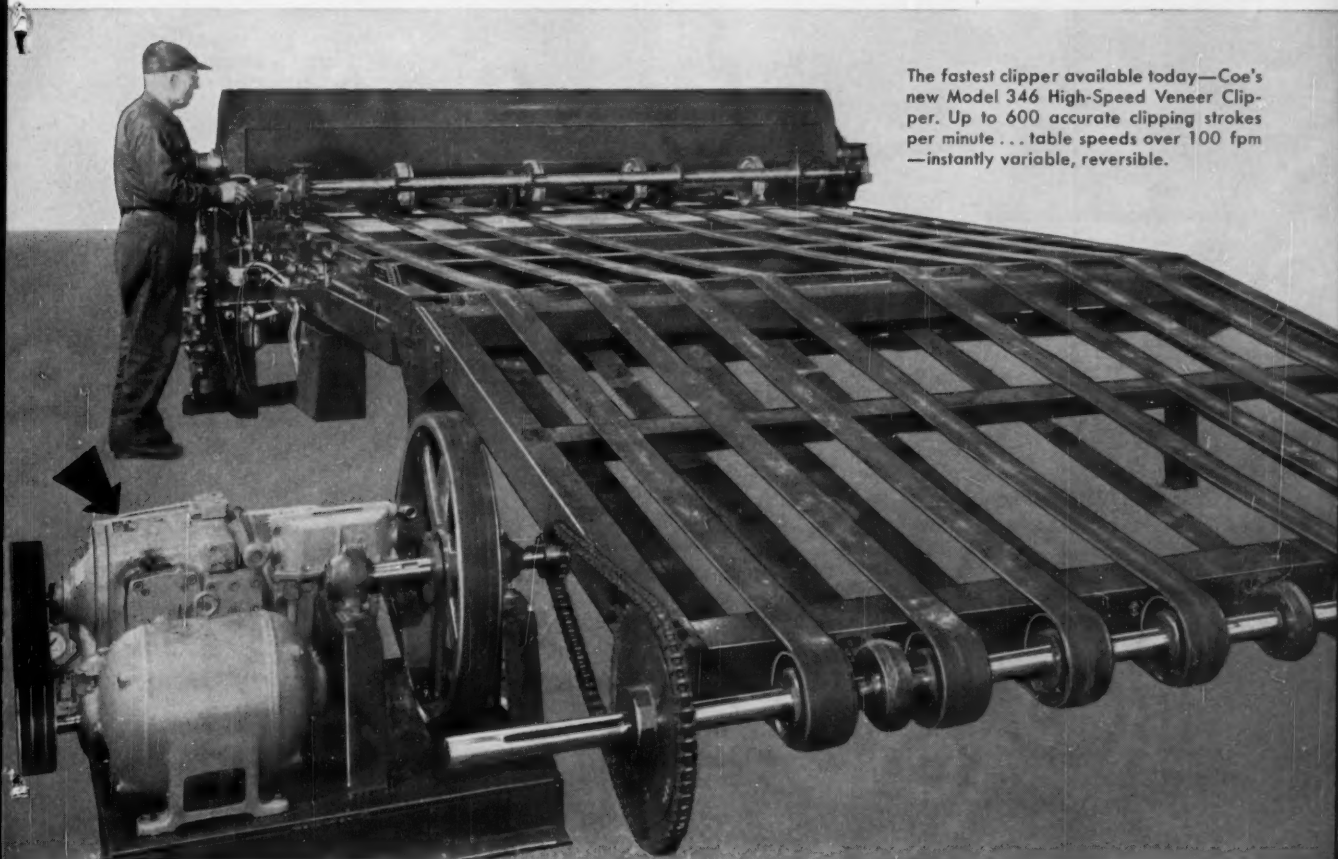

From Oilgear Application-Engineering Files

HOW OILGEAR "ANY-SPEED" DRIVES BOOST VENEER CLIPPING SPEEDS—ACCURACY

CUSTOMER: Coe Machinery Company, Painesville, Ohio

DATA: For high-speed, accurate sizing of single sheets of veneer in motion, table feed drives for new veneer clippers must be instantly, infinitely variable, and instantly reversible to clear slips and jams at the knife if ragged or defective veneer is encountered. Complete

control should be through a remote, single lever. Drive must be rugged, compact, trouble-free . . . provide smooth, stepless, shock-free, uniform acceleration and deceleration from zero to maximum in either direction . . . easy to install and maintain.

The fastest clipper available today—Coe's new Model 346 High-Speed Veneer Clipper. Up to 600 accurate clipping strokes per minute . . . table speeds over 100 fpm—instantly variable, reversible.

SOLUTION: Shown above as standard equipment on Coe's new Model 346 high-speed veneer clippers are Oilgear heavy-duty DHC-88, two-way, *Any-Speed* Transmissions. Coe reports, "Variable table speeds are instantaneously afforded in forward and reverse. These drives are arranged to give belt speeds from approximately 70 to 175 fpm by movement of a single lever. The quick stop and reverse of this drive is very desirable if ragged or defective veneer slips and jams at the knife. This drive is equally desirable when the table drive is used to unload veneer storage decks between the clipper and the lathe." Oilgear *Any-Speed* Drives bring out the best in machines due to the many other "plus" features such as: cushioned power; automatic overload protection; automatic electric power conservation; totally sealed—safe in hazardous atmospheres; constant torque; automatically self-lubricated to insure long, trouble-free life.

Machinery manufacturers and users agree that for superior heavy-duty performance on sawmill carriages, gang-saw feeds, conveyors, capstans, winders, centrifuges, textile, paper, tape, rubber, and food processing equipment—it's Oilgear . . . for the lowest cost per year!

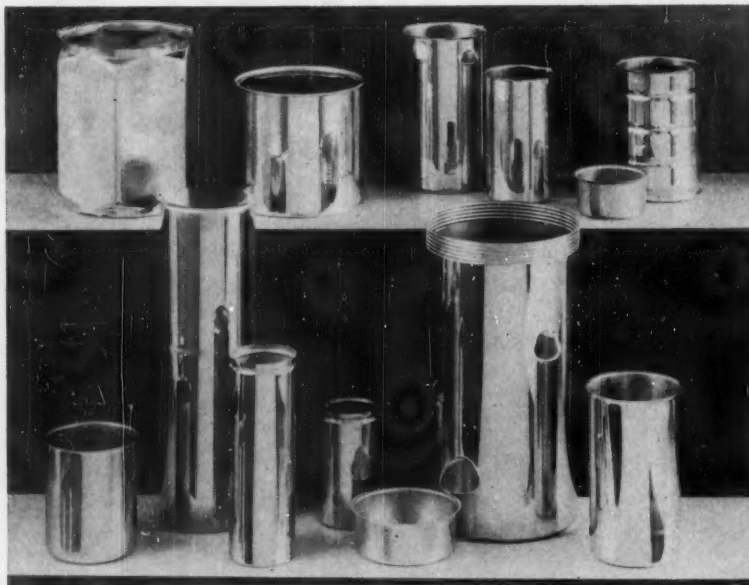

For similar practical solutions to *YOUR* linear or rotary drive and control problems, call the factory-trained Oilgear Application-Engineer in your vicinity. Or write, stating your specific requirements directly to . . .

LONG AND SHORT aluminum cans are produced by new deep draw process. Seamless, one-piece can bodies are drawn in single stroke on double-end horizontal presses at Kaiser Aluminum's container plant. Wall thickness of rigid cans can be as thin as 0.005 in.; light weight reduces shipping costs. Naturally bright cans are used for packing foods and industrial products.

rolling during manufacture. Hence, for best magnetic characteristics, the core is built up of straight strips of metal laid at right angles into a rectangular shape.

With the new material, L, E, U-shaped, or even rectangular punchings can be stamped from a sheet of steel in one operation. Besides improving the magnetic path, this simplifies core construction.

Called Cubex steel, the new metal has about the same chemical composition as the standard magnetic material—about 3 per cent silicon, 97 per cent iron. The real difference between old and new comes from steel processing from rough sheet into the final product. The process for producing Cubex steel has been demonstrated to be operative in sheets thick enough for use in large transformers and motors.

Westinghouse engineers, however, emphasize that, thick or thin, Cubex steel has not yet graduated from the laboratory. Uses requiring only thin sheet are expected to be first commercial applications, possibly within a few months.

System Sends Computer Data Over Conventional Voice Line

CHICAGO — A 40-channel system transmits computer information by wire or radio. The system, developed by the Collins Radio Co., is designed for reliability and efficient use of bandwidth.

Called "Kineplex," it is described as a data transmission system which will operate in a single telephone voice band of standard quality. It will accept at its input, with suitable conversion, binary data from any source. The system is designed to accept 40 channels of 60, 75, or 100-word-per-minute telegraph data or, with accessory converting equipment, data from standard business machine cards at a rate of 200 cards per minute, or binary data from high-speed magnetic tapes not to exceed 3000 bits per second.

Laboratory tests conducted over both radio and wire circuits have shown the system to be tolerant to most commonly encountered transmission distortion and noise.

Topics

Two and one-half billion electric light sources of more than 10,000 types and sizes will be made by the lamp industry in the U. S. this year, according to Donald L. Millham, GE Lamp Div. vice president and general manager. The production exceeds output during the first 30 years after Edison developed the light bulb.

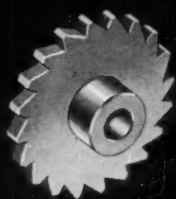

Cleverer, these Chinese—engineers in Communist China claim to have developed the ability to produce major engineering feats without Soviet assistance. The country has 800,000 engineers and technicians, compared with 170,000 in 1952.

Dizzy Canadian robot reveals sensations of a man under extreme accelerations and simultaneous complex motions of different types. An apparatus consisting of an assembly of miniature gyroscopes, each about the size of a spool of thread, attaches to the head and provides information on the subject's equilibrium, his idea of where he is, and where he thinks he's going. Study was carried out by Dr. W. H. Johnson of the Defense Research Medical Laboratories, Toronto.

Detecting heart beat in an unconscious, pulseless person is possible with a small, portable device called a cardiac monitor. It uses transistors, is battery-operated, and provides a continuous, instantaneous visual monitoring of heart rate and rhythm.

Nuclear nomenclature applied to the first atomic-powered U. S. merchant ship results in the designation *NS Savannah*, NS for nuclear ship in place of SS for steamship. The *NS Savannah* is the namesake of the *SS Savannah*, first steamship to cross the Atlantic.

First vertical oxygen storage tubes have been installed by Air Products Inc. for Granite City Steel Co., Granite City, Ill. The storage bank, made up of 30 tubes which stand 80 ft above the ground, holds 125,000 standard cubic feet of 99.5 per cent pure oxygen stored under 450 psi pressure.

Engineer Shortage Measured, Remedies Posed

Is There a Shortage? Report Says "Yes"

Facts Show Engineers Dynamic Force in Economy

NEW YORK—Has there been, is there now, and will there be a shortage of engineering manpower? According to a just-published research report, the answer is a resounding "yes."

Since 1880, the report prepared by Deutsch & Shea Inc. for Indus-

Entrants to the engineering field averaged about 46,000 every year for the period 1950-1957 for a total of 321,600. This total includes new engineering graduates, estimated at 204,800, approximately 79,400 without college degrees, some 22,000 graduates with degrees in other fields who are able to apply their training to engineering, and about 15,400 former engineers working in other fields who returned to their profession.

trial Relations Newsletter Inc. shows, the size of the engineer labor force has increased more than 20 times as fast as the total civilian labor force. From 1950 to 1957, the pattern of growth was marked by three distinct factors: First, total expenditures for research and development increased from \$2.9 billion in 1950 to \$6.5 billion in 1956. Second, total expenditures for new plants and equipment rose abruptly with a larger share of these expenses being channeled to introduce new products

Society Says Engineering Shortage Is, Isn't Too

Lays Down Seven Points To Clear Conflict in Views

WASHINGTON — Recent developments have provided fresh evidence for those who contend that there is a severe shortage of engineering and scientific personnel and, at the same time, for those who maintain that there is not a shortage.

The National Society of Professional Engineers has observed and studied various statements, reports, and analyses. Here quoted is part of the NSPE statement:

1. Special action to increase today's supply of engineers is not considered necessary or desirable since engineering enrollments are at an all-time high and are continuing to increase.
2. An artificial stimulation to further increase enrollments in engineering will severely handicap institutions that devote adequate attention to the capable students.
3. Assumption that Russia launched the earth satellite before the United States solely because it had trained more scientific personnel in recent years than this country, we believe is not valid and could lead to unwise and damaging decisions. We believe it would be more logical to assume that the controlling factors were priorities assigned to money and emphasis, rather than a shortage

and processes. Third, the increase in capital investment was much greater in industries that are the primary employers of engineers. Those industries that employ large numbers of engineers expanded considerably more than the economy as a whole.

The National Science Foundation in an independent survey of industry's needs in the scientific field reported, "A sizable number of firms said they had been forced to curtail projected increases in their research and development programs because of the lack of qualified personnel."

of technical personnel in the U. S.

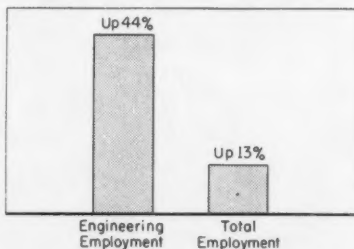

4. Emphasis now more than ever should be placed on quality rather than quantity. Potential engineers should be better grounded in fundamentals when they enter the engineering educational program and should be better informed as to the qualifications essential for an individual to become a successful engineer.

5. In view of the present limitations of facilities and faculties, the substantially increased enrollments in our engineering institutions are causing serious difficulties at the present time. Any program which will substantially add to the present number of students must include means to resolve these limiting factors.

6. It should be emphasized that projects such as the earth satellite, guided missiles, etc., depend on highly advanced technology—a mere increase in numbers of those with first degrees will not provide the type of highly advanced technical knowledge which is necessary. It should also be noted that any program based on present needs will not succeed in solving today's technological problems. A program starting today will not produce a single highly qualified engineer or scientist for at least six years.

7. Experience has shown that we have wasted engineering talent by using it at a level below that which it is capable of performing. Improved utilization of engineering talent can do more for an immediate need than any other single program.

In the distribution of the major engineering groups among specific industries, five of the eight major groups of engineers are largely em-

Increase in the engineering profession compared with increase of the labor force as a whole, 1950-1957.

Copyright, 1957, John S. Barnes Corporation

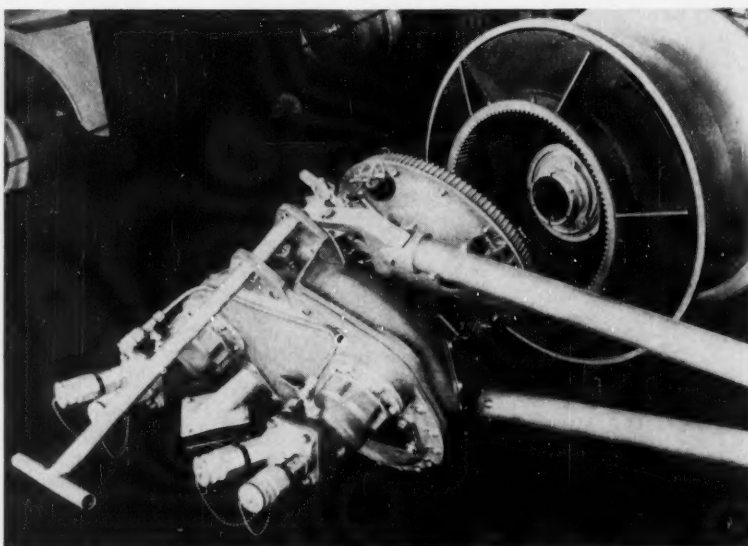

Engineers' starting salaries from 1950 to 1957 increased more than four times as much as the cost of living; significantly more than salaries of other workers. Because salaries of other occupations are to some extent administered upward and salaries of engineers are not, it seems that the shortage of engineers was even more substantial than the salary figures indicate.

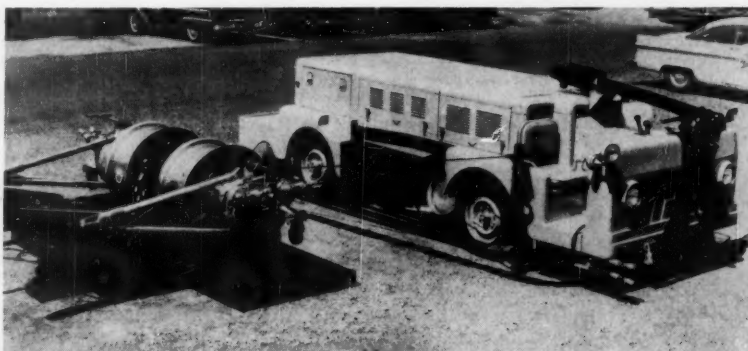

played in one or two industries. This suggests that demand for these groups of engineers depends not only upon general conditions throughout the economy, but also upon current conditions in these particular industries.

During the period 1950 to 1957, the largest increases in expenditures for research and development and expenditures for new plants and equipment occurred in the aircraft, electrical equipment, and electric utilities industries. Other substantial increases occurred in the nonelectrical machinery, primary metals, and chemical industries.

It seems clear that the accessions of college graduates between 1957 and 1960 will not satisfy the total demand for engineers from 1957 to 1960. The gap between the demand for engineers and the supply of college graduates to the engineering profession will continue to be filled by men partly trained to fill engineering jobs. In high skill areas, shortages of trained men will either not be filled at all or will be filled by the employment of graduate engineers with only partial knowledge of the particular industrial field. In less skilled areas, the excess of demand over supply will doubtless be met by the employment of men without college degrees.

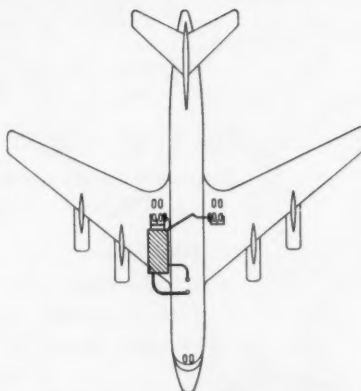

Prototype power vehicle and "wheel mover" units transmitted driving power directly to B-52 landing gear with brakes set to simulate aircraft. The wheel moving hydraulic motor here is in process of being attached to a ring gear on the shoe of a landing gear wheel. The V-bar leading off right is a torque reactor attaching to hub of landing gear rear wheel.

Ground Movement of Giant Jets Promised by Wheel Mover Units

Wheel Mover Plus Power Units Can Supply All Ground Needs

STAMFORD, CONN. — Taxiing giant jet aircraft by moving its wheels to and from the loading gates of airport passenger terminals was simulated recently when a prototype "wheel mover" propelled a B-52 landing gear with brakes set to equal weight load of the aircraft. The "wheel mover," developed by Consolidated Diesel Electric Corp., transmitted torque directly to wheel rims at speeds up to 5 mph against braking power to 200,000 lb of inert weight.

Aircraft and power vehicle with wheel mover sets in place.

Control of the speed and direction of each wheel was maintained

TORRINGTON SPHERICAL ROLLER BEARINGS

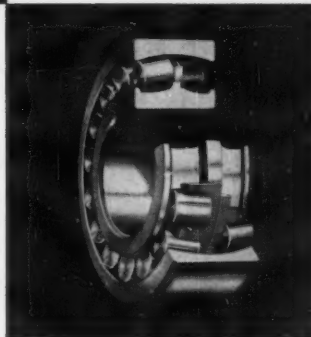

The Manitowoc 4500 Power Shovel is equipped with Torrington Spherical Roller Bearings in 7 critical heavy-duty, high-speed applications where they eliminate stress concentrations and provide long service life.

How to get a big lift

Torrington Spherical Roller Bearings in critical positions on the Manitowoc shovel help it handle tons of earth and rock with ease and speed!

Accurate roller-to-race conformity and positive roller guidance of Torrington Spherical Roller Bearings insure long, trouble-free service. They are used on the swingshaft, PTO sprocket support, front drum main shaft, front and rear drums, countershaft, PTO pilot and vertical travelshaft. These self-aligning bearings insure smooth anti-friction operation and efficient transmission of power despite heavy radial and thrust loads, housing misalignment and shaft deflection.

Wherever heavy-duty construction equipment is at work, Torrington Bearings are contributing to efficiency and long service life. **The Torrington Company, South Bend 21, Ind.—and Torrington, Conn.**

by a small remote handset which in actual operation would be handled by the aircraft pilot.

Towing devices have been tested and found wanting. Due to the great weight of new jets, towing places strain on the aircraft frame. Also, pilot had no control in ground movement of multimillion-dollar craft.

The "wheel mover" units are planned for use with other elements to make up a system of servicing the Boeing 707, Douglas DC-8, Convair 880, and Lockheed 188 with pneumatic, electrical, and ground movement power.

AIRCRAFT ANTICOLLISION MIRROR, infrared sensitive, is being tested at Aerojet-General Corp. System consists of a horizon scanner which protrudes from the aircraft and continuously sweeps 360 deg of sky in azimuth and $\pm 7\frac{1}{2}$ deg in elevation. Incoming rays from engines of approaching aircraft are deflected downward through an optical system, and focused on a photoconductor cell. From here, information is processed, electrically amplified, and presented to the pilot on a visual indicator. CAA has reportedly claimed that 80 per cent of aircraft collisions—including last year's Grand Canyon disaster—could have been prevented with a similar infrared or electronic instrument.

Not a light bulb inside a coil of wire but metal, suspended in space and heated to molten temperature by effects of a radio field, is shown stirring itself. New process eliminates contamination in research on pure metals.

Ultrapurified Metals Yield To Snake Charmer's Wiles

Radio-Frequency Field Floats, Melts, Stirs Metals

PITTSBURGH—Ultrapurified metals are being prepared for laboratory study by heating them at 4500 to 5000 F in half a minute or less while floating them in space, free from contact with container walls. Called levitation melting, the technique was developed through combined efforts of scientists at the Westinghouse Research Laboratories and the University of British Columbia.

Levitation melting is used to prepare highly purified laboratory-scale ingots of niobium, zirconium, titanium, molybdenum, and dozens

of alloys. Compressed metal powder is placed inside a copper coil which carries a high-frequency electric current. The electric current generates a field of force which floats the metal inside the coil and at the same time, heats it to a white-hot molten mass.

At white heat, metals such as niobium and titanium react chemically with any known vessel in which they are melted. Levitation melting eliminates this problem entirely. No containing vessel is required, since the molten metal floats freely in space, confined only within itself. The whole process is carried out inside a sealed vessel containing an inert gas such as helium or argon, thereby protecting the pure metal from contamination by the air. The

News Roundup

molten metal reportedly even stirs itself, yielding unusually uniform alloys from mixtures of different metals.

HANDFUL OF POWER — 40 lb thrust, 1-second duration—is supplied by this midget, solid-propellant rocket motor. Designed by Atlantic Research Corp. to perform spin and retro functions on Vanguard, the unit is now available commercially. Weight is 0.6 lb, length 4.8 in., diameter 1.5 in. Possible applications include acceleration of small masses, packaged, fast-response thrust services, experimental rocket engineering. The motor has a shelf life of over three years; requires no assembly before use. Igniter is actuated by a 6-v dry cell.

Study Radio Transmission for Vast Reaches of Outer Space

Pave Way for Communication With Manned Space Ships

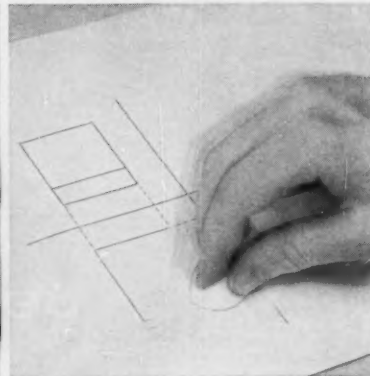

SUNNYVALE, CALIF. — The problems of sending and receiving space messages and identifying objects far from earth are under study in a large, new space communications laboratory opened recently. Findings by more than 50 Lockheed Missile System division scientists may well pave the way for communication with manned space ships of the future or for the remote guidance of unmanned space ships.

DRAFTING TRENDS

Use of Liquidator makes it easy to erase large areas on POST pencil cloths without affecting the surface.

Improve drawing board cleanliness for better prints

Poor original drawings make poor prints. No matter how good the reproduction equipment, an original that is marred by graphite smears, has become spotted through frequent handling, or has been creased too often will produce a difficult-to-read print.

The standards of drawing board cleanliness that a draftsman establishes for himself and the steps he takes to prevent smearing or spotting of his drawings are as important as his technical skills.

There are two principal causes of poor prints. First are graphite smears. As straight edges, triangles, scales, etc., are moved over a drawing, dust and graphite particles begin to smudge and smear it. In addition when the draftsman's hands touch the drawing they often transfer body oils and tiny bits of dirt which affect reproducing quality.

(l. to r.) POST Liquidator, POST Dry Cleaning Pad, POST Dust-It.

Preventing smears

The easiest way to eliminate smears and spots is to prevent them in the first place. Good clean drafting habits are all important.

Probably the most important precaution to prevent smudging or spotting of drawings is to lightly sprinkle Post's

Dust-It over the surface before beginning work. Dust-It cleaning compound prevents dirty drawings (1) by picking up the dirt and (2) by cleaning drafting tools at the same time. It is free from gritty or abrasive substances and does not interfere with the draftsman's work.

Cleaning pads

Should smudges occur they should be removed immediately—preferably with a Post dry cleaning pad. The pad contains a special compound which is sifted in a sprinkling manner through the pad over the area to be cleaned. Then, by rubbing very easily with the pad, graphite smudges disappear without damaging the drawing.

Eradicating unwanted elements

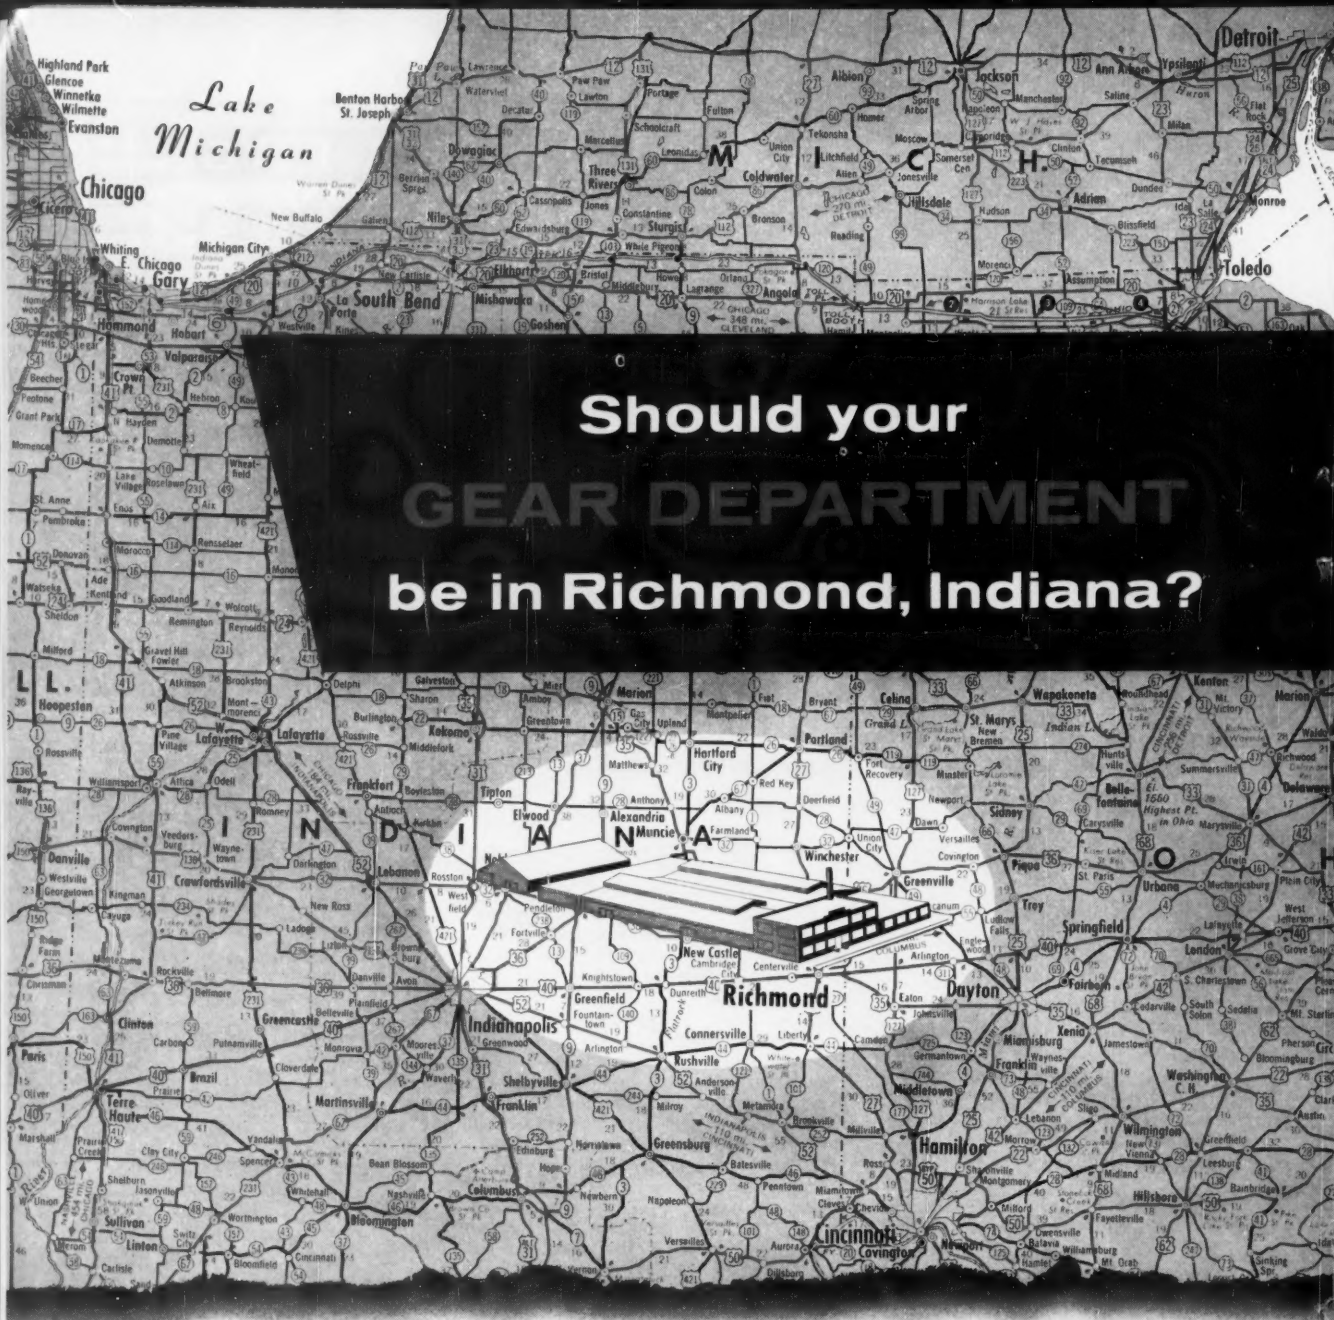

Care in removing unwanted elements is necessary to avoid marring the drawing surface of the paper or cloth. For users of Post's popular pencil cloths, an extremely simple and satisfactory method of eradicating is the use of Post Liquidator.

Applied on POST cloths, Liquidator saves time and labor in erasing large areas. More important, it permits repeated redrawing "good as new" over eradicated areas without change of pencil degrees. This assures identical line uniformity.

For further information on these Post products see your Post dealer or write today to the Readers Service Division of Frederick Post Company, 3652 N. Avondale Avenue, Chicago 18, Illinois.

**Should your
GEAR DEPARTMENT
be in Richmond, Indiana?**

This possibility is worth your consideration. Many of our best customers use us in this manner—as their *gear department*—with all of our facilities geared to their gear needs. Would you like to learn how successful these associations have been, and what a similar service might mean to you in terms of reduced costs and better gears?

Our Sales people are gear engineers. Would you like to talk to one? Write us at Richmond, Indiana—gear headquarters for many of America's leading industries.

High Pressure Valve	Fasteners
Centrifugal Fans	Plastics
Silicone Rubber Sheets	Servomotor-Rate Generator
Fasteners & Small Parts	Plastic Foam & Sponge Rubber
Aircraft Hose Assembly	Hydraulic Fittings
O-Rings	Switches

NEW PARTS & ENGINEERING EQUIPMENT—descriptions start on page 194

ITEM NUMBER	ITEM NUMBER
Speed-Reducing Apparatus	Conductivity Cell
Metal Bellows	Speed-Deviation Recorder
Anchor Nut	Air-Tight Fastener
Miniature Coaxial Cable	Silicon Rectifier Diodes
All-Glass Valve	Hydraulic Cylinder
Concentric-Shaft Differential	Motor-Generator Sets
Silicon Solar Cells	Antibacklash Gears
Lock Washer	Thermal Ribbons
Instant-Reversing Motors	O-Ring Compound
Miniature Inductors	Test-Point Jacks
Flow Meter	Miniature Bell Timer
High-Strength Metal	Air-Pressure Switches
Nylon Balls	Toggle Pads
V-Belt Pulley	Blower Unit
Captive Fastener	Industrial Solenoids
Miniature Gears	Reciprocating-Shaft Seal
Teflon Tubing	Footless Motor
Printed-Circuit Contacts	Silicon Transistors
Miniature Pump	Thermoplastic Material
Induction Motor	Cable Clamp
Ceramoplastics	Pipe Plugs
Black Nylon Screws	Subminiature Switch
Meter-Relay	Temperature Transducer
Photoelectric Scanners	Rotary Pump
Shuttle Valve	Multi-Circuit Timers
Synthetic Seal	Magnetic Brake
Adjustable Slip Clutches	Rod-End Bearings
Elapsed-Time Indicator	Industrial Triode
Alignment Bolts	Magnetic Relay
Vacuum Valve	Drafting Instrument
Snap-Action Switch	X-Y Plotter
Adjustable Torque Handle	Heavy-Duty Divider
Small Clutch	Servo-System Analyzer
Silica Glass Tubing	T-Square
Electrolytic Capacitors	Pressure Transducer
Multispeed Transmissions	Vertical File
Nonreset Counters	DC Power Supply
Piloted Air Valves	Slip-Ring Assembly
	Magnetic Tape Recorder

CUT

**YOUR DRAFTING TIME
AND COSTS WITH
CLEARPRINT
"FADE-OUT" PAPER**

Leading engineers and designers report that Clearprint Fade-Out Paper speeds up their drafting 10 to 15% . . . cuts their costs proportionately. And Fade-Out Paper gives them prints which are sharper and easier to read, because grid lines do not reproduce.

Clearprint's perfect working surface invites pencil and pen — lines are sharp and clean. It withstands repeated erasures, too, without the slightest ghosting.

See how Clearprint Fade-Out Paper can solve *your* drafting problems. Order a trial roll now, and apply it to your various drawing needs.

Available with grids ruled
4x4, 5x5, 8x8 and 10x10
lines to the inch.

CLEARPRINT

HOT-SPINNING TITANIUM to form strong, lightweight pressure vessels is being done at Titanium Fabricators Inc. on this specially designed vertical spinning lathe. Completely hydraulic, the machine permits close control of speeds, feeds, and pressures. Hydraulic system is rated at 3000 psi—can exert 12 tons of pressure on the small area being formed. Spinning tool is easily removed; can be replaced by machining tools for contour work or for machining edges prior to welding. Circular, preheated blanks used in the process are 6 Al, 4 V titanium alloy, a relatively new heat-treatable alloy developed by the Army.

BANANA UNLOADER with traveling sponge rubber pockets combines speed and careful handling to unload 60 stems of bananas per min. The gantry crane is self-propelled on tracks; has two control stations—one in the cab and a remote position in the ship's hold. Bananas are hand-loaded, one stem per pocket and discharged, gently, on conveyor belts for fast handling. A switch on the bottom of the marine leg automatically lifts the boom if the ship rides upward. An automatic belt takeup adjusts for changes in belt length as the boom moves. George L. Day Co. is building four of the units for the United Fruit Co.

(Continued from Page 15)

Subjects under study in the three-story laboratory include: 1. Effect of outer space's cosmic rays on radar and radio signals. 2. Radar pattern presented by various space vehicle and missile shapes. 3. Effect of the ionosphere on such signals. 4. Characteristics of various antennas when installed in missiles.

An anechoic chamber—or "quiet room" measuring 20 by 70 ft—produces electronic conditions to be found 300 miles in space by eliminating all stray electronic signals. Much of the advanced research is being done in connection with the Navy's Polaris ballistic missile.

Metal Filters in Complex Shapes Produced by Fiber-Metallurgy

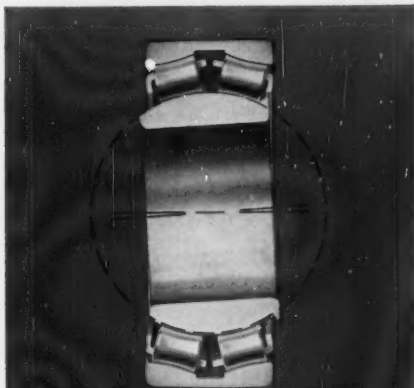

CLEVELAND—Using metal fibers instead of powders, metallurgists at Horizons Inc. are producing complex porous shapes for a number of useful applications. For example, metal filters produced by the new method are claimed to maintain unusually high strength, ductility, and porosity under a variety of conditions—including high temperature. The new technique uses wire in fiber or filament form obtained by a wire cutting or shaving process, in the place of metal powders.

In one method of preparing

fiber-metal shapes, felting procedures are used similar to those used in the paper making industry. A suspension or slurry of fiber is deposited as sheet in equipment such as Fourdrinier machines. The suspension is in contact with a porous mold or die. Subjected to a vacuum, the liquid is drawn away from the mold, leaving a mat of fiber on the surface. This surface can be quite complex, to produce similarly irregular-shaped elements.

Physical variations are obtained by controlling fiber length, diameter, kinking, surface roughness, and porosity. Greater strength in a predetermined direction is

self-aligning ... CAN'T BIND

HOW SELF-ALIGNMENT WORKS. Spherical inner ring, free to align in any direction, assures full load capacity regardless of shaft deflection or support misalignment.

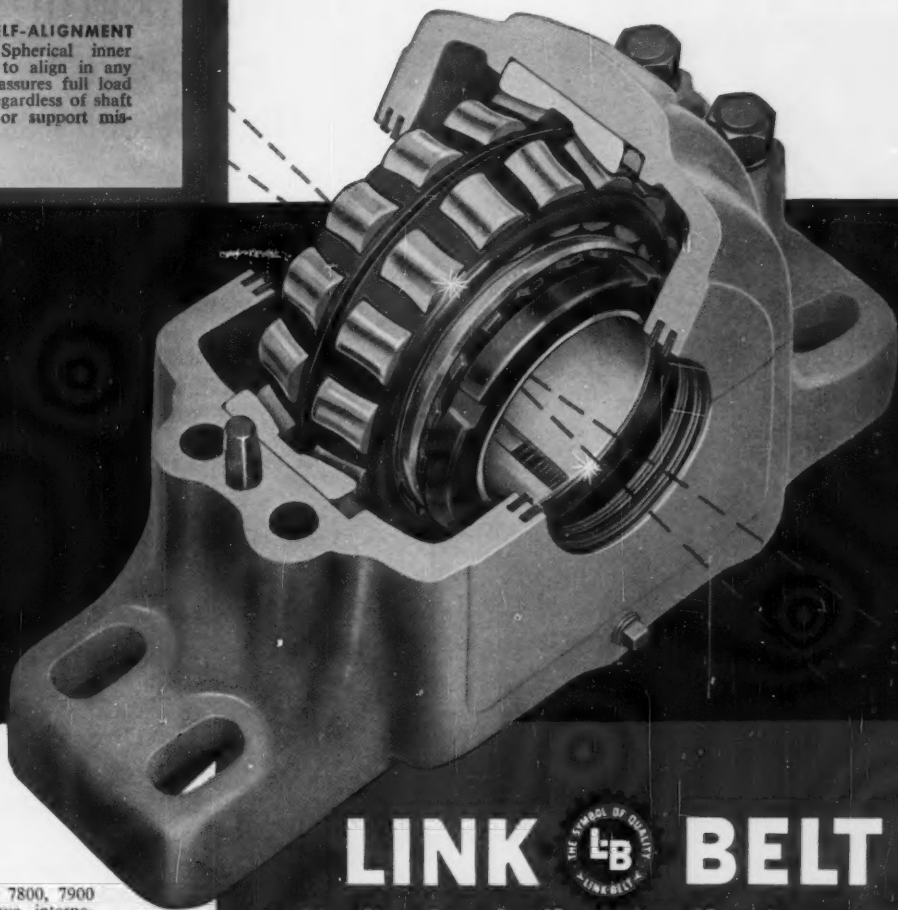

Husky bearings in husky housings adjust immediately in any direction

When high-impact loads deal out punishment, shaft deflection may spell a quick finish for ordinary bearings. But this rugged Link-Belt bearing is *self-aligning* . . . won't "pinch" or bind when misaligned.

Complete protection is provided by effective seals which

block entrance of dirt, escape of lubricant. Durable housing—machined as two perfectly matched parts provides easy installation without shims or alignment rings.

Get full data on Link-Belt's complete bearing line from Book 2550. Ask any of 40 offices.

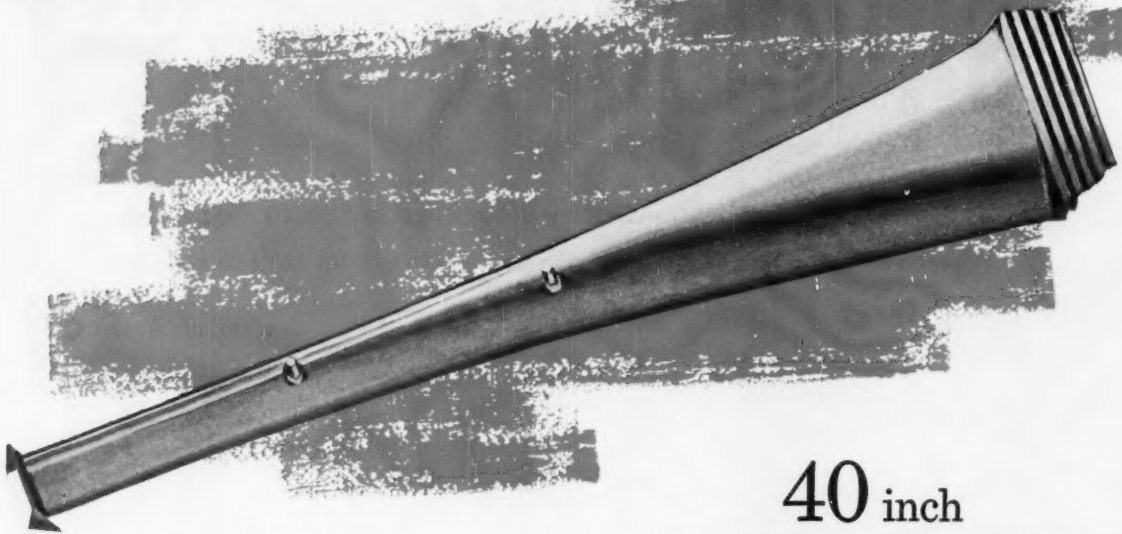

Series 6800, 6900, 7800, 7900 roller bearings have internationally standardized boundary dimensions.

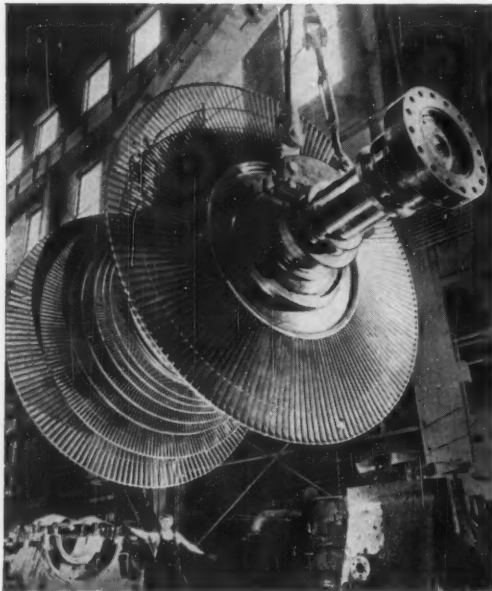

LINK BELT
self-aligning ball and roller bearings

LINK-BELT COMPANY: Executive Offices, Prudential Plaza, Chicago 1. To Serve Industry There Are Link-Belt Plants, Sales Offices, Stock Carrying Factory Branch Stores and Distributors in All Principal Cities. Export Office, New York 7; Canada, Scarboro (Toronto 13); Australia, Marrickville (Sydney), N.S.W.; South Africa, Springs. Representatives Throughout the World.

HAYNES Alloys help solve the *tough* erosion problems

40 inch TURBINE BLADES Protected Against High-Velocity Erosion

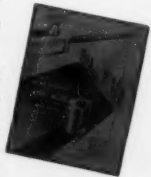

...Two rows of 40-inch blades are shown on this double-flow, low-pressure steam turbine spindle. A 27-in. strip of HAYNES STELLITE alloy has been silver-soldered on each blade as protection against high-velocity erosion.

Blading at the cold end of modern condensing-type steam turbines is subjected to severe erosion. Rim speed of some turbines approaches that of a high speed bullet—even small water particles can cause rapid wear on most metal parts at these high velocities.

Yet when the leading edges of these blades are protected with shields of HAYNES STELLITE alloy, they remain in operation for as long as 19 years! This dramatic example of ruggedness is one of the reasons HAYNES cobalt-base alloys are used in many industries to solve abrasion and erosion problems.

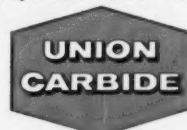

For information on long-wearing and erosion resistant alloys, send for our Booklet. Write HAYNES STELLITE COMPANY, Division of Union Carbide Corporation, General Offices and Works, Kokomo, Indiana.

HAYNES ALLOYS

HAYNES STELLITE COMPANY

Division of Union Carbide Corporation

"Haynes," "Haynes Stellite" and "Union Carbide" are registered trade-marks of Union Carbide Corporation.

achieved by preferred orientation of the fibers on the mat.

For high-density parts, the felted material is pressed through rolls or dies. As sheet, it can be worked continuously by felting, rolling, annealing, and sintering.

Cylindrical and convoluted filter elements are made with fiber-resin mixtures. A tubular die filled with fibers is vibrated and thermoplastic resin is added. The mixture is then heated, pulled through the die by vacuum, allowed to cool, and sintered.

Salary Increases for Engineers Taper Off

Lower Average Pay Boosts Parallel Management Rise

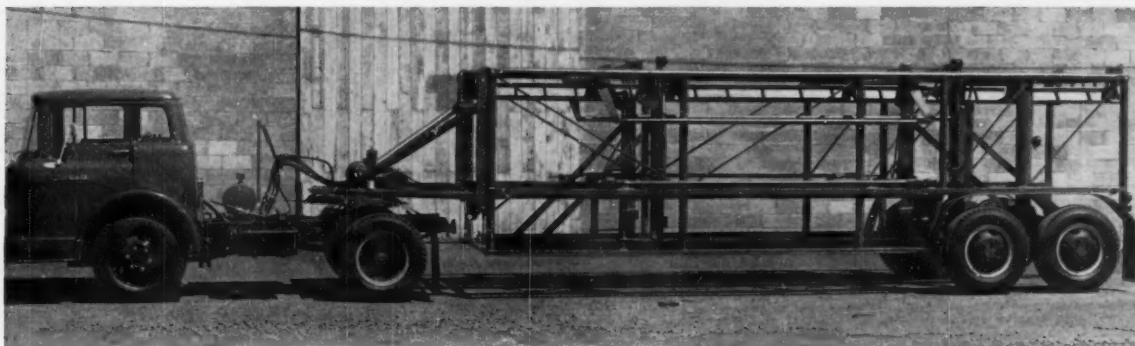

NEW YORK—Salary levels of engineering and associated personnel in U. S. industry rose an average of 5.9 per cent between 1956 and 1957. According to a survey conducted by the American Management Association's Executive Compensation Service, this increase is appreciably lower than the 8.6 per cent salary rise for the year ended in 1956.

The change may indicate that compensation of engineers, closely paralleling percentage increase of top and middle management compensation, has become relatively uniform of late.

(Please turn to Page 28)

DO-IT-YOURSELF GYROCOPTER, produced in kit form by Bensen Aircraft Corp., may become the motorscooter of air travel. Small and light, it can be lifted by one man; carried on the tailgate of a station wagon. Dismantling or assembly requires 20 min. Removable fibreglas cabin is available. Autorotating rotor is not power-driven, making control of the craft more like an airplane than a helicopter, except that it will not spin or stall. Prime mover is an air-cooled, 4-cylinder, 2-cycle engine rated at 40 hp. Pusher propeller is mounted directly to engine shaft. Cruising speed is 60 mph; landing speed, 7 mph.

TRAILER STRADDLES FREIGHT to ease loading and unloading operations. Trailer, built by the Edwards Equipment Co., can pick up preset load in less

than 50 sec, unload in less than 15 sec. It hauls fruit in boxes or bins, cattle in a special rack, baled hay, lumber, and canned goods in cases.

U. S. Army Redstone Missile

THE

FORWARD
LOOK

CHRYSLER CORPORATION

BRUNING Reproduction Machines help Chrysler Corporation in Vital Missile Work!

Most of the great work that Chrysler Corporation is doing in missiles must be classified for security reasons. It is no secret, however, that this progressive firm — creators of the advanced "forward look" in automobiles — has played a vital role in the development of the ballistic missile indicated above.

It is no secret, either, that Chrysler Corporation utilizes the outstanding advantages of modern Bruning Copyflex diazotype reproduction machines in this important work. Shown here is the imposing battery of Copyflex machines employed by the Chrysler Corporation. You can see for yourself the famous problem-free installation of Copyflex — no exhaust venting, plumbing, or auxiliary equipment.

You can see, too, how Copyflex provides busy operators with such advantages as roomy feed tables, extra-large, convenient stacking trays.

And that's only part of the story. You, like Chrysler Corporation, should be benefiting by such modern Copyflex advantages as greater mechanical speeds, faster return of originals, synchronized exposure and development, automatic separation of originals from exposed prints, automatic stacking, and front-or-rear print delivery.

If you're not getting these important advantages, then every day you delay getting modern Copyflex is costing you time and money. Make the experience of Chrysler Corporation your basis for mailing the coupon below. You'll be glad you did!

Shown here is the impressive battery of Copyflex machines used by Chrysler Corporation for important reproduction operations in vital missile work. Machines need no venting, plumbing, or auxiliary equipment . . . provide Chrysler Corporation with important operating benefits.

Copyflex Gives You All These Advantages

Greater Convenience of Operation! Modern Copyflex gives printing widths up to 54" to simplify feeding of large tracings, facilitate multiple feedings. Such features as extra-large delivery trays, automatic separation, and front-or-rear delivery further speed operator's work.

Faster Mechanical Speeds! New Copyflex models introduced within the past two years offer sharply increased speeds — up to 30% faster than before. Synchronized

exposure and development assure top quality prints, one knob control simplifies operation.

Problem-Free Installation and Operation! Clean, quiet, odorless... Copyflex requires no vents or plumbing, needs only an electrical connection for operation. Precision-engineered design, including use of selenium rectifiers instead of troublesome vacuum tubes, assures trouble-free operation.

HEART OF
AUTOMATION

**MODERN
ELECTRONIC
ENGINEERING
GIVES PRECISE
MOTOR SPEED
CONTROL**
1/100 — 10 H. P.

Modern industrial electronic engineering has been coordinated with electric motor design to provide a versatile means for obtaining the full possible advantage of speed control in DC motors while operated from the regular alternating current power line. Grid controlled "Thyatron" tubes are utilized for power controlled stepless variation to supply motor armature power. Patented feedback, or "Servo" circuits provide constant torque capability over wide speed ranges of as high as 60 to 1 in some models and a minimum of 20 to 1 in others.

Engineering News Roundup

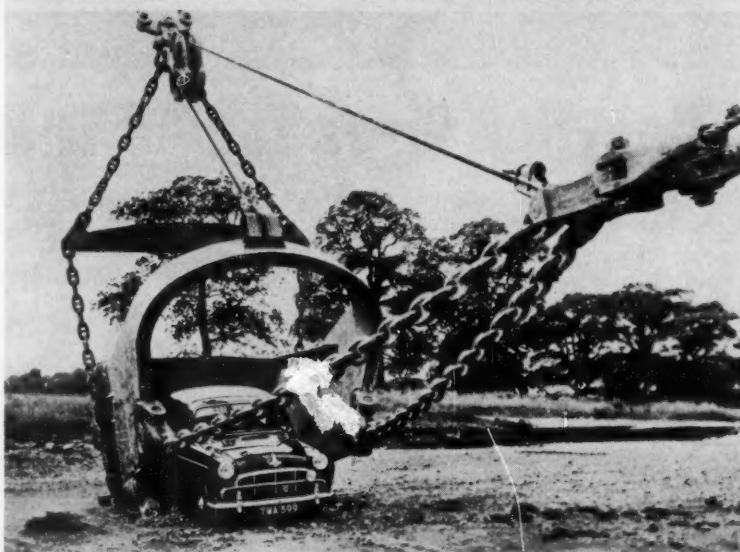

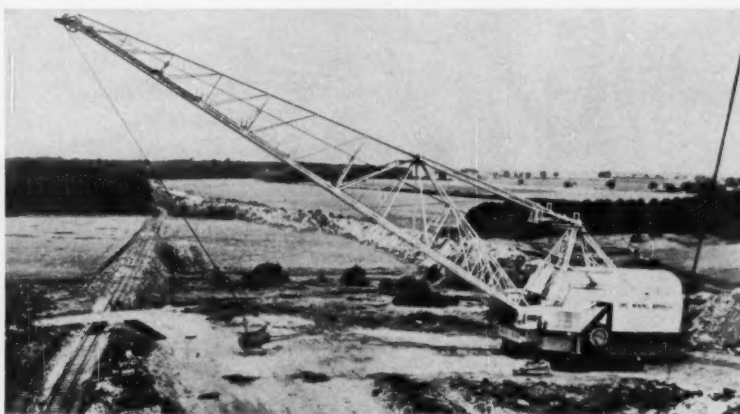

(Continued from Page 25)

The study covered rates and ranges of pay for 33,797 employees engaged in 58 major engineering, scientific, and administrative activities in 263 companies located throughout the U. S. and Canada. This is the first year that Canadian firms have been covered by the survey; hence, the comparisons drawn with the previous year apply only to the U. S.

Percentage salary increases during the year varied for individual

fields. The maximum shown was for quality control engineers, who averaged 7.9 per cent in raises. Some electrical and mechanical engineers increased their compensation by an average of 7.5 per cent. The smallest increases shown were for systems and procedures analysts at 3.8 per cent.

Median annual salaries currently paid to engineers in all fields of activity combined range from about \$5400 in the lowest or entering category to approximately \$13,100

WORLD'S BIGGEST WALKING DRAGLINE mines iron ore in Lincolnshire, England. Built by Ransome & Rapier Ltd., the dragline was transported piecemeal and assembled on the site. The machine, weighing 2000 tons, has a motor enclosure the size of two tennis courts and a jib nearly 300 ft long with head 200 ft high. It can gorge 30 tons in one drag and swing loads at more than 20 mph to a heap. Operated by four or five-man teams on three shifts, it can lift 25,000 tons per week; can take 7-ft strides on two feet, each 48 ft long, $9\frac{1}{2}$ ft wide.

MINIATURIZATION AWARD

THE AWARD

Miniature Precision Bearings, Inc. cordially invites you to participate in the Annual Miniaturization Award Competition. The Miniaturization Award for 1957 will be presented on March 23, 1958 at the 1st Annual Awards Dinner in New York. The Award will consist of a piece of original sculpture, symbolizing miniaturization, by a leading American artist, which is cast in bronze and inscribed. There will also be Honorable Mentions for additional outstanding contributions.

PURPOSE OF THE AWARD

To increase public knowledge of the importance of miniaturization and to stimulate further activity within industry toward the advancement of the concept of miniaturization.

CRITERIA FOR AWARD

Contributions considered for the Award should have been made in the recent past to be eligible for consideration by the Miniaturization Awards Committee. Details of criteria on which awards will be based can be obtained by writing: Awards Committee, Miniature Precision Bearings, Inc., Precision Park, Keene, N. H.

JUDGING OF ENTRIES

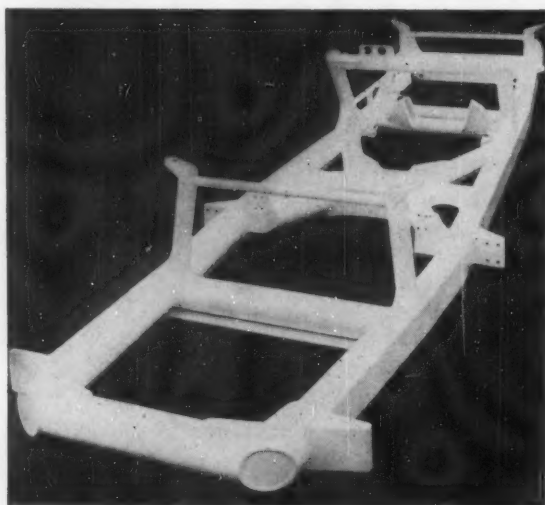

The awards will be judged by an eight-man independent committee comprised of the following individuals: R. L. Goetzenberger, *Educational Consultant, Minneapolis-Honeywell Regulator Co.* / Dr. George H. Lee, *Director of Research, Rensselaer Polytechnic Institute* / Morton Pavane, *Electronics Engineer, Air Research and Development Command* / Gerard Piel, *Publisher, SCIENTIFIC AMERICAN* / Gustave Shapiro, *Chief, Engineering Electronics Section, Electricity and Electronics Division, National Bureau of Standards* / George F. Sullivan, *Editor, THE IRON AGE* / Elmer Tangerman, *Editor, PRODUCT ENGINEERING* / Arthur W. Weber, *Vice President, Engineering & Manufacturing, Corning Glass Works* / Horace D. Gilbert, *President, Miniature Precision Bearings, Inc.*

ENTRIES

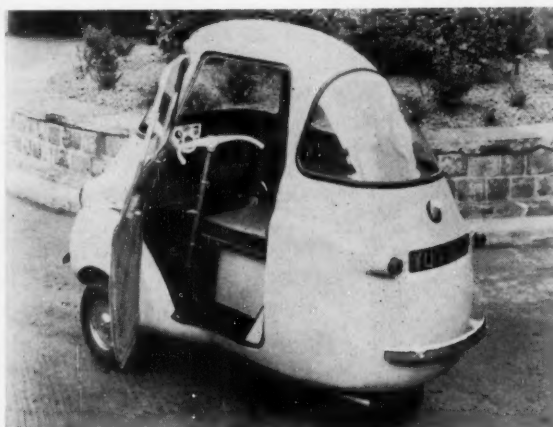

Description of a specific contribution should be made in as complete a form as possible and mailed to the Awards Committee, Miniature Precision Bearings, Inc., Precision Park, Keene, New Hampshire. Samples of the product itself, blueprints or photographs will be helpful. Descriptive information should include some of the design characteristics of the product and the specific problem solved by the miniaturization effort.

DEADLINE

In order to be considered for the 1957 Miniaturization Award, entries must be received by the Awards Committee by January 31, 1958.

HEAVIEST AUTOMOBILE FRAME in the industry will appear on the new Argonaut—a big, expensive sports roadster going into production (hand assembly) in Cleveland. Frame is 5-in. cold-drawn steel tubing with 3/16-in. walls and 1/4-in. attachments. Coated with white vinyl paint, it weighs 1060 lb, giving the car an unusually low center of gravity. Argonaut has a wheelbase of 127 in.; length of about 215 in. Height to cowl is 37 in.; weight, 4000 lb. Weight distribution is 50-50 providing good roadability and handling. Power steering is not used. Two-place body is aluminum with bucket seats. The engine displaces 392 cu in.; is said to be one of the most powerful V-8s in a production auto. Appearance detail have not been released.

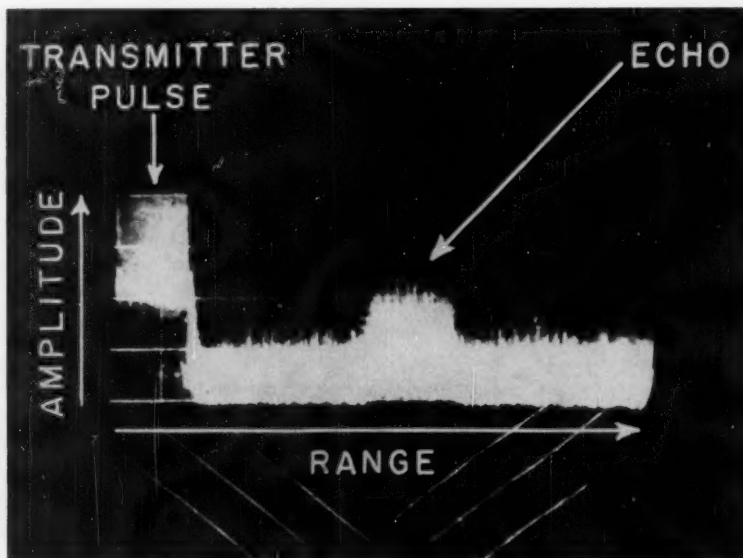

HANDLEBAR STEERING and hydraulic brakes are features of the new English-built Scootacar. The three-wheeled vehicle has space for three passengers; comes equipped with directional signals, windshield wiper, and heater. A 197-cc engine, with four-speed gearbox (optional reverse), provides speeds to 45 mph. Fuel consumption is about 80 mpg. According to Hunslet Engine Co., Locomotive Builders, Scootacar is a new approach to personal transportation, being definitely an enclosed scooter and not a miniature car.

Thirteen most powerful hydraulic turbines in the U. S. will be built by Baldwin-Lima-Hamilton and the Newport News Shipbuilding and Dry Dock Co. for the Lewiston, N. Y., Power Plant. Each turbine is rated at 200,000 hp when operated under a 300-ft head.

at the highest nonmanagement level. By and large, levels of compensation in Canada are lower than those prevailing in the U. S. For example, Canadian median salaries for engineers of all types fall between \$4700 at the lowest level and \$10,400 at the highest level.

Classified in the lowest level are engineers with bachelor of science degrees plus up to one year of experience. Classified in the highest level are engineers of long experience responsible for planning, conducting, and supervising assignments involving large and important projects.

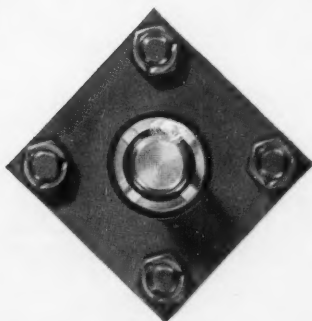

Many individual salaries, of course, vary considerably from the median. For some specific types of engineering jobs, individual salaries are as high as \$20,000 a year. Salaries of physicists, mathematicians, and other scientists range from a median of \$5400 a year at the beginning level to a median of \$14,000 at the highest level.

RADAR ECHO from Sputnik I third-stage rocket, 595 miles away at this "sighting," was recorded at new radar installation. Millstone radar is described on Page 5. Scientists at M.I.T.'s Lincoln Laboratory started sightings of Sputnik I with single radio receiver, expanded their efforts to include observations from four separate locations, have recorded Sputnik signals on both the 20 and 40-mc frequencies.

Why the Leader gives you more!

Because of his laboratories and know-how the leader can give you better design. The leader can afford more efficient tooling and greater quality control.

The leader can give you a better cylinder without a premium price.

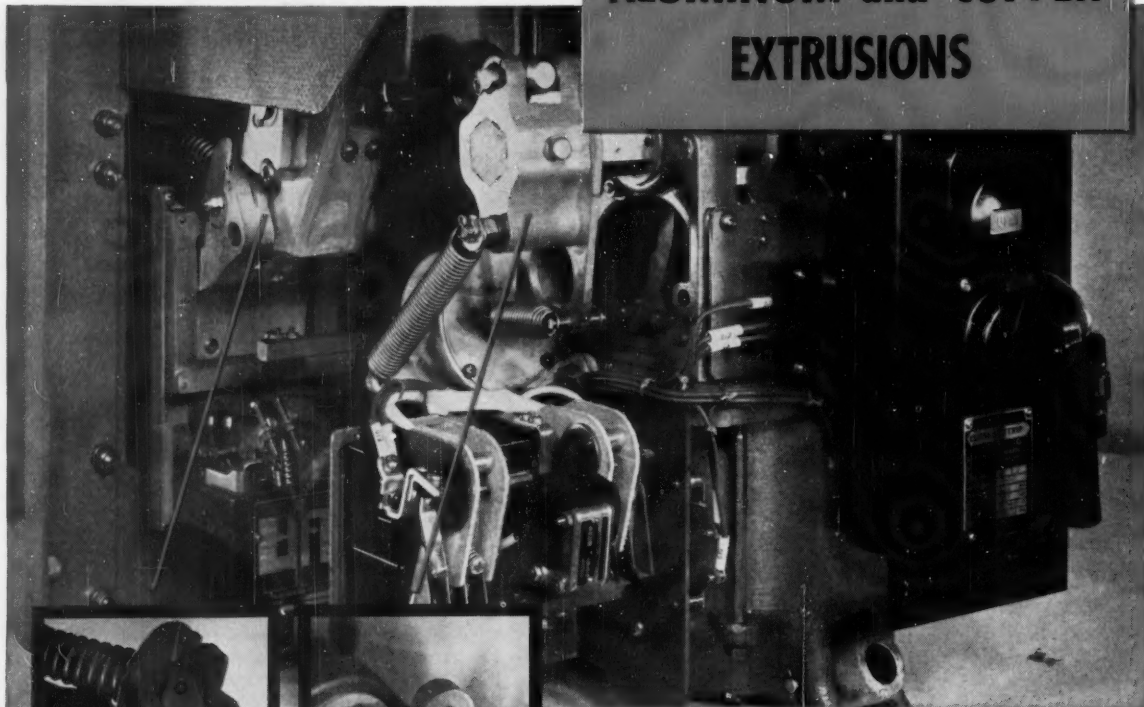

The leader in air and hydraulic cylinders is Hannifin.

CIRCUIT BREAKERS

Revere T. A. Service an Important Factor in Ultimate Design of Parts

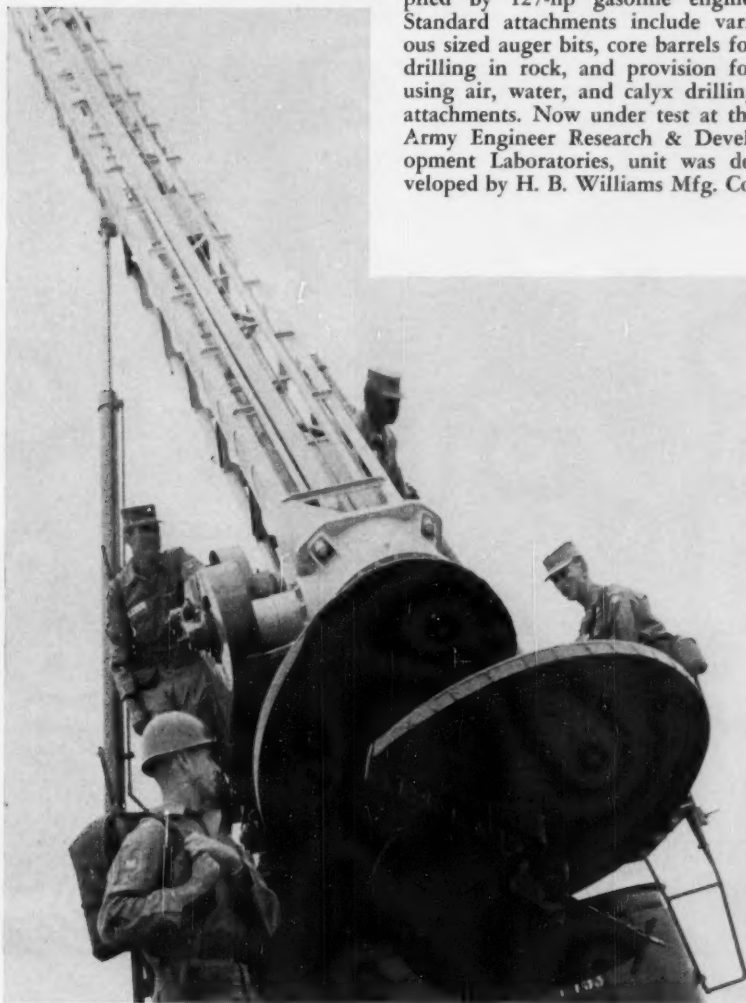

The larger of the two extruded and drawn copper shapes shown at extreme left started out on the drawing board as two pieces. It was thought that a single shape of this size could not be made satisfactorily. At this point, I-T-E Engineers got together with Revere's T. A. (Technical Advisory) Service and threshed things over. The final result is the one-piece extrusion shown and a reduction in machining time.

Aluminum was selected for the other extrusion shown because I-T-E found that it cost less per pound of metal and had a higher strength ratio when compared to a casting. Also, space was a factor. In all, Revere supplies 5 copper and 2 aluminum extrusions for KD and KE type I-T-E Circuit Breakers. All were designed to fit specific requirements of I-T-E Engineers. Where it could be used satisfactorily, aluminum was applied because of economy, while current carrying members called for copper.

This is still another example of Revere supplying the metal that will do the best job and with the greatest economy . . . be it aluminum, copper or any one of their alloys. So, with new things happening all the time in non-ferrous metals it can pay you to keep in close touch with Revere.

BIG BIT for the Army will be used for fast construction of field fortifications, shallow wells, and waste-disposal pits. Mounted on a standard 5-ton truck, the mobile earth-auger will dig holes up to 6 ft in diameter and 22 ft deep in practically any type of earth strata. Boom is hydraulically actuated.

Power for the digging unit is supplied by 127-hp gasoline engine. Standard attachments include various sized auger bits, core barrels for drilling in rock, and provision for using air, water, and calyx drilling attachments. Now under test at the Army Engineer Research & Development Laboratories, unit was developed by H. B. Williams Mfg. Co.

Microminiaturization Applied to Transistors

Wee Transistors Are Formed
By Vapor Deposit, Film

WASHINGTON — Many electronic items may be made smaller through a new technique for reducing the size of transistors. Army research scientists call this new method the "missing link" in their continuing effort to cut down both bulk and weight of Ordnance electronic devices. They foresee

military equipment reduced to one-tenth of its present size in some items, and expect their printed-circuit transistor to be equally valuable to civilian industry.

The process was invented by two civil service employees of the Army's Ordnance Laboratories in Washington, Dr. J. W. Lathrop and Mr. James R. Nall. The new process seems ideally suited to automation and mass production of transistor systems at low cost. Reliability and resistance to shock and vibration reportedly will be

CLAYMONT your for **Fabricated**

Claymont's new Fabrication Shop provides more than 100,000 square feet of floor space containing a complete range of efficient production line layout and modern shipping facilities.

You'll save time and money by letting Claymont perform difficult, time-consuming machining and fabricating operations on your steel plate before it's delivered to you.

Claymont Has The Facilities... Our new Fabrications Shop is completely equipped to perform all these steel plate operations:

**WELDING • SHEARING • PUNCHING • MILLING • PAINTING
BENDING • CUTTING • BORING • GRINDING • CHIPPING • EDGE
PREPARATION • ROLLING • PRESSING • DRILLING • SHAPING
PRIMING • SHOT BLASTING**

Your Supply Of Steel Is Assured... Claymont's is a completely-integrated operation. From the se-

lection of raw materials through blast furnace, open hearth, rolling mill to steel plate fabrications... every operation is performed within the company.

You Get Uniform Quality In Accordance With Your Needs... Because Claymont's operations are fully integrated, we are able to exercise rigid quality controls throughout every single stage of production and fabrication to assure that customer specifications will be met.

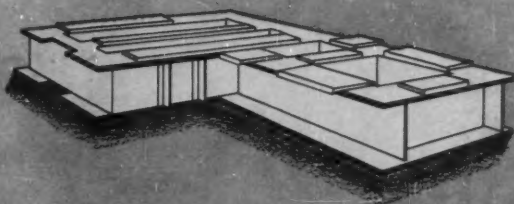

Bring your steel parts problems to Claymont. For complete information contact the sales office nearest you.

dependable source Steel Parts

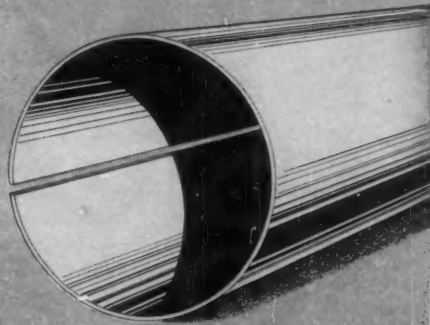

Production Weldments—Many production component parts for which castings are presently being used can be safely and profitably replaced by weldments. The advantages: cost savings plus reduction in weight with no loss in strength. Claymont is completely equipped to produce weldments in many sizes and shapes, and from a wide variety of steels.

Flame-Cut Patterns—Claymont has multiple-torch travagraphs for producing large quantities of irregular shapes that exceed the gage or size limitations of blanking presses; and single-torch, semi-automatic radiagraphs for cutting straight cuts and simple patterns, circles and smaller-quantity jobs. A special type of radiagraph is used to prepare edges prior to welding.

Heavy-Duty Plate Forming—Claymont's heavy-duty mechanical pressing, bending, and shaping equipment is capable of a wide variety of forming operations on heavy steel plate.

no beeps
...just clicks

This is probably about the most groundborne relay ever built by Sigma. Since its leviathan specifications include a brutish size of $3\frac{1}{2}'' \times 2\frac{3}{16}'' \times 2\frac{3}{8}''$ and a weight that can reach $\frac{5}{8}$ of a pound (even bigger and heavier when hermetically sealed), it's exceedingly doubtful that it will ever fly, orbitally or otherwise. Since that kind of quick fame is out of the question, the "61" should be able to do some other — though less timely — sort of job. It can, and here's where you product designers can start paying close attention.

The 61 is a polarized DC power contactor, with four separate heavy-duty contact circuits (DPDT only) for switching up to 20-ampere resistive loads in response to momentary $\frac{1}{4}$ to $\frac{1}{2}$ watt signals. Two switching forms are available: Form Z, magnetic latch-in, single or dual coils, and Form Y, magnetically biased, single coil. For special jobs, center-stable 61's can also be built (Form X). Since the Form Z types latch firmly in either of two positions by magnetic means, there are no mechanical wearing surfaces; the one part that does move uses miniature ball bearing pivots.

POLARIZED LATCHING CONTACTOR

Some of the places we'd expect the 61 to be particularly useful include machine tool control panels, battery-powered control systems, and other equipment where big fat loads must be dependably switched by comparatively meager signals, in the presence of contact-disturbing shakes, shocks and rumblings. Space and money can also sometimes be saved by a 61, in replacing a pilot and slave relay combination where 225-450 mw. signals have to control 1 to 2 kw. loads.

Series 61 relays are quite easy to order, once you master Sigma's international, all-encompassing system of code designation (readable east to west, north to south, without binoculars). Example: 61FZ2A2B-200-GD SC = an unenclosed latching DPDT 61 with 200-ohm dual coils and silver alloy contacts. Bulletin, on request, explains all this and more.

SIGMA INSTRUMENTS, INC.

increased.

The new transistor method is said to start with a tiny wafer of the metal germanium. Photosensitive film provides precise masks on a ceramic plate for positioning the pin-point electrodes of the transistor. The electrodes are formed by vapor deposit. The process cuts the size of transistors to about $\frac{1}{20}$ in. wide and 0.01 in. high.

CORROSION PREVENTION using an automatic electrical system, has been developed by Charles Englehard Inc. A ship's hull corrodes due to variation in composition of the steel—causing it to act like two different metals. Some areas become anodic and corrode, while other areas serve as cathodes. In Englehard's system, thin platinum discs are mounted on the hull, insulated by an 8-ft square neoprene blanket. Supplied with current from the ship's generators, they make the entire hull cathodic. This overcomes the galvanic electrical flow between different parts of the hull; eliminates corrosion. Voltage supply to anodes is automatically monitored.

Transducer Error Equals Baseball at Three Miles

NEW YORK — An electromagnetic, angle transducer, called the vernier resolver, has resolution of better than ± 3 sec of arc. This is about the same angle as that subtended by a baseball at three miles. The

News Roundup

resolver, developed by Bell Telephone Laboratories under an Air Force contract, has potentially wide applications for visual and automatic angle reading systems.

It has been used in an "angle encoder" which converts a shaft angle to a numerical representation acceptable to a digital computer. The standard deviation of the error of this complete encoder is less than 10 sec of arc.

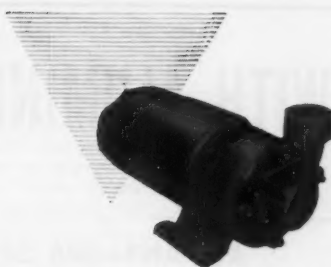

The vernier resolver is a reluctance type, variable coupling transformer. In its present design, two output voltages vary in amplitude as the sine and cosine of 27 times the angle through which the rotor is turned. Thus, the equivalent of a standard resolver driven by a 27:1 gear train is obtained.

Business Failures Lag Growing Total of Firms

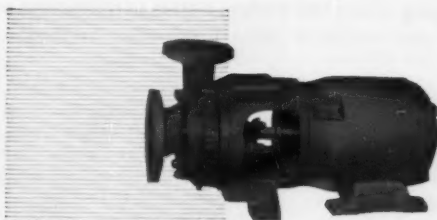

NEW YORK—Business failures have not kept pace with the increasing total of business firms. According to the Business Economics Div. of Dun & Bradstreet Inc., more than half of the failures occur in businesses that have been in existence for five years or less. The proportion of "younger" failures has been declining steadily in the past 10 years, from 77.6 down to 58.6 per cent. However, the toll among businesses, ten years or older, has increased almost steadily in the same period, from 9.1 to 18.3 per cent.

In manufacturing per 10,000 concerns, there were 143 failures in electrical machinery, 116 in transportation equipment and 69 in machinery. A breakdown of failure causes for all business shows "inadequate sales" responsible for 47.9 per cent of losses, "competitive weakness" as next most prominent fault, 21.2 per cent.

Stone, clay, and glass manufacturers showed lowest rate of failures with only 30 per 10,000 concerns. By states, the highest failure rates per 10,000 concerns were Nevada, 141.8; California, 135.0; New York, 106.5. Lowest failure rates were in South Dakota, 10.2, (Please turn to Page 40)

DESIGNING WITH ALUMINUM

NO. **26**

ADVANTAGES OF ALUMINUM FOIL STRIP FOR ELECTRICAL WINDINGS

Conversions from round copper wire to aluminum interleaved strip windings are bringing improved design, better performance and lower costs to a wide range of mass production applications.

ALUMINUM RIBBON, interleaved with insulation material, may be used successfully in place of copper in such applications as: transformers for radio and television; motor starters and aircraft accessories; field and rotor windings for motors and generators; coils for solenoids, relays and ignition devices; chokes, filters and a vast range of similar electromechanisms and electronic devices.

Conversion to Foil Strip Offers Design Advantages

Although the design of any electromagnetic unit depends upon its specific application requirements, aluminum ribbon conductor offers several advantages to all applications converted from round copper wire:

1. **Reduction in void space often allows equivalent cross-section size.** Whereas round copper wires leave unfilled spaces between strands, the flat aluminum ribbons lie neatly together in a compact mass free of voids. This can often allow equivalent winding cross-section size. Where cooling ducts and layer insulation are used, the aluminum ribbon and interleaving insulation will almost always fit the same winding gap as copper.
2. **Excellent heat dissipation reduces operating temperature.** Aluminum conducts heat better than any insulation or impregnating material. A ribbon-wound coil has substantially the same temperature throughout a layer of conductor because each layer is a solid conductor and dissipates heat to the outside. Absence of voids eliminates formation of local "hot spots"—has reduced temperature as much as 100°F. This control of temperature normally allows a reduced aluminum cross-section for equal current carrying capacity.
3. **Lower space factor helps reduce cost and weight.** Because ribbon wound coils generally operate at temperatures 20 or more degrees (F.) lower than wire wound coils, it is possible to reduce the 1.64:1 aluminum-to-copper area ratio that is theoretically necessary. In actual use, area

factors are about 1.5 and occasionally have been as low as 1.25, making possible weight reductions of over 50%... with cost savings of 30 to 40% for copper wire conversions in sizes #24 or larger.

4. **Manufacturing method reduces problem of conductor tensile strength.** Because wire-drawing tensions are absent in manufacturing the slit aluminum ribbons, and because aluminum strip has better heat dissipation and lowers coil temperatures, comparative conductor strength has little significance. Aluminum ribbon conductor is readily available and readily adaptable to high production techniques.
5. **Effective joining methods available at low cost.** A wide variety of joining techniques and equipment—all proved in thousands of high-production electrical devices—offer economy equal or better than copper for both initial cost and maintenance.

Two Design Approaches Meet Conversion Problem

The fundamental design problem in converting from copper to aluminum conductor is, of course, to provide for and accommodate the additional coil cross-section needed for equal conductance and reactance, and at the same time provide equal dissipation of heat. Two basic approaches may be taken to this problem.

First, the conductor cross-section may simply be increased by the appropriate factor (1.5) to give the same ampere turns and resistance; or second, the wiring area may be changed

This is one of a series of information sheets that discuss the properties of aluminum and its alloys with relation to design. Extra or missing copies of the series supplied on request. Address: Advertising Dept., Kaiser Aluminum & Chemical Sales, Inc., Department PD-1, 919 No. Michigan Ave., Chicago 11, Ill.

to allow a better ratio of conductor to insulation where space is critical or the coil may be split and connected in series to further help this conductor to insulation ratio.

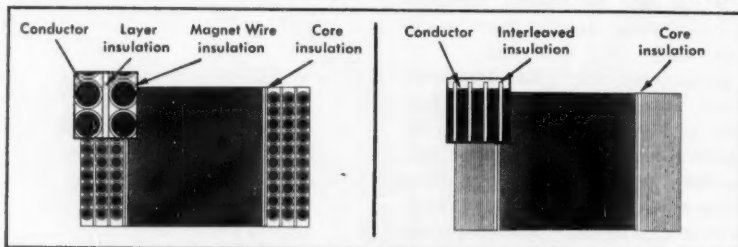

Designing for a compromise between these two approaches is favored by the physical shape of aluminum strip conductor, and allows the designer to make use of the advantages of both approaches. The aluminum ribbons are produced by slitting from foil, which may be mill-rolled to any requested thickness, and thus are available in any desired combination of gauge and width, unrestricted to standard gauge sizes. And—to the designer's advantage—the aluminum conductor proportions may be exactly determined by the rectangular geometry of the wiring cross-section.

Elimination of the voids between circular conductor sections together with the better dissipation of heat due to this design results in working temperatures normally about 20°F. cooler than in round wire. Some ribbon wound coils have reduced "hot spot" temperatures by as much as 100°F., and have accepted without damage excess loadings that have destroyed electromagnetically-equivalent copper wire wound coils.

When aluminum ribbon conductor is substituted for copper wire to give equal current carrying capacity and equivalent resistance, the aluminum conductor assembly is little or no larger and sometimes smaller—than its copper prototype.

Insulation Need Not Have High Dielectric Strength

Because the potential between successive wraps is usually low, the insulation materials between layers normally does not require high dielectric

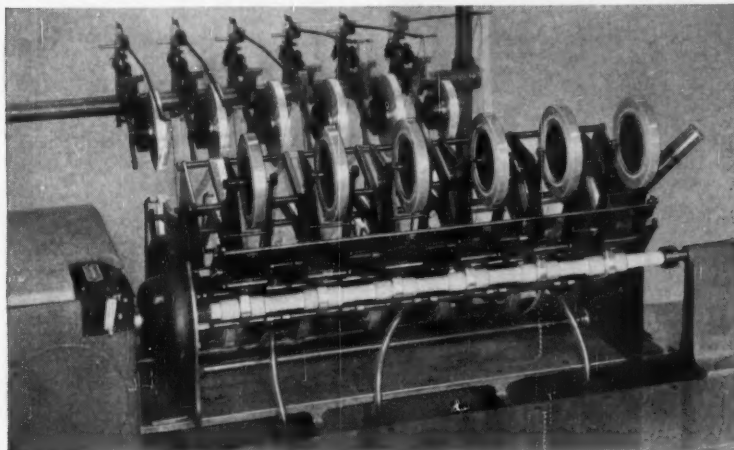

Conventional insulated copper wire coil (left) utilizes only 70 to 85% of available space. Aluminum interleaved strip conductor coil (right) utilizes up to 97% of overall space.

strength. Condenser paper 0.00025" in thickness may be used in many applications where space is highly critical.

"Mylar"* and "Teflon"* plastics have excellent dielectric, tensile and scuffing strength. They are available in gauges down to 0.00025" and accept, without aging, higher temperatures than paper. The higher cost of "Mylar" for Class B insulation, and the still higher cost of "Teflon" for Class H insulation are jus-

the use of aluminum ribbon by adding little more than an unwinding reel, a suitable tension device and guides for the insulation and aluminum strip.

Equipment for multiple winding of smaller coils often is too specialized for easy adaptation, but usually may be converted by more detailed alterations. In present practice, both conductor ribbons and insulation strips are wound from reels of pre-slit material.

Modern foil coil machine designed specifically for aluminum ribbon coil windings. (Universal Winding Company, Providence, R. I.)

tified for conversion of high operating temperature coils.

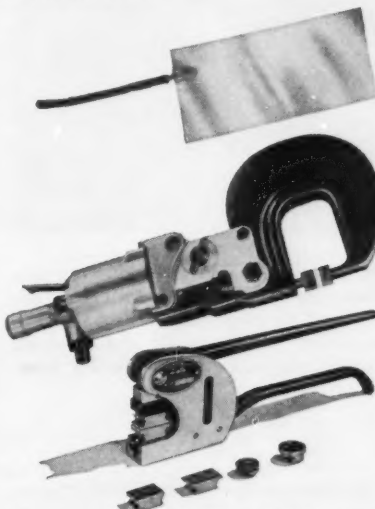

Fixed coatings such as resins and enamels are efficient and eliminate separate interleaving. Although they are not commercially available at this time, should they become more readily available in the future, this factor would further reduce material cost.

Anodized conductor similarly needs no separate insulation, resists temperatures up to 750°F., and eliminates the need for separate interleaving materials. Extreme care is necessary to prevent edge crazing of the anodic coating during the winding operations. The anodic coating is inherently porous and requires sealers against moisture. Such sealers are presently limited to a maximum temperature of about 400°F.

The strip insulation lowest in weight and cost is condenser tissue of suitable gauge. The paper is limited by a tendency to become brittle after lengthy exposure to temperatures above 250°F., but otherwise is an excellent general purpose insulator. Because of its natural porosity, it may be readily impregnated with resin sealers for protection against moisture, or with sealer-adhesive materials to bind the interleaved coil into an integral unit.

Most of the existing machinery for handling single-wound, heavier size conductors can be adapted readily to

*Dupont trade names.

Above: Tinned copper wire pressure welded to aluminum foil. Below: Coldweld tools made by Utica Drop Forge and Tool Division of Kelsey-Hayes Company.

Tested Joining Methods Offer Economy, Versatility

The joining of round, flat, and stranded leads of aluminum or copper to ribbon conductors of aluminum has been accomplished in a variety of ways. Soldering or brazing of leads and terminals may be accomplished by use of suitable aluminum fluxes and solders, by ultrasonic soldering techniques, or by the use of fiber-glass brushing in conjunction with recommended aluminum solders on the heavier gauge materials.

Cold or hot pressure-welding is an extremely economical method by which the metals are pressed into plastic-flow merging of surfaces to give a true weld. Flash welding and inert arc welding also produce good welded joints. Standard crimping procedures have been used effectively although the ribbon conductor shape also permits punching to receive wide flange connecting parts without need for crimping.

Where dissimilar metal joints are used and are susceptible to high humidity conditions, suitable resin sealers may be applied at the joint to minimize the possibility of galvanic corrosion.

The operating and cost efficiencies of aluminum strip conductor are most marked when replacing copper wire of #24 AWG or larger, but savings have been realized by conversions through #30 gauge. Economies in conductor cost, including insulation, have been recorded from 30 to 40%.

Kaiser Aluminum does not manufacture electromagnetic coils or insulation materials, but has wide availabilities of aluminum ribbon conductor and a special technical staff to assist coil manufacturers and users in all details relating to the use of its conductor materials in their products. Inquiries for such assistance are welcomed and sample coils can be fabricated to customer specifications for their evaluation in possible conversions.

For immediate attention to your request for this technical service or samples, or for more detailed information, contact the Kaiser Aluminum sales office listed in your telephone directory. Transverse curvatures can be developed from straight to a 30-in. radius. Grips work along all four sides.

Suggest Satellite Be Used To Bounce Phone Signals

Satellite Bounce Easier Than Crossing Mountains

NUTLEY, N. J.—Long-distance telephone conversations of the future may be bounced off earth satellites to provide communication with all parts of the globe, a radio scientist predicted recently. According to Richard E. Gray of Federal Tele-

communication Laboratories, "present problems of communicating over mountains or oceans could be bypassed by aiming radio signals at the smooth 'skin' of a satellite."

The envisioned technique would utilize microwave equipment now available. Directional antennas would focus the microwave beam directly at the satellite. Radio impulses would be reflected in all directions, but a large percentage would blanket the earth, where

MACHINE DESIGN

ASCO makes Solenoid Valve selection simple

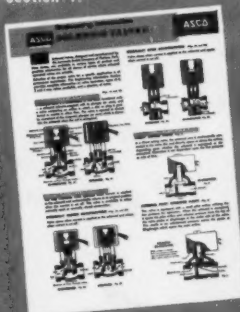

**Comprehensive Design Engineering Data Now Available
Keys Proper Solenoid Valve to Application**

Specifically designed to make the selection of solenoid valves simple, the ASCO Valve Catalog gives you the most comprehensive engineering data available to aid you in your solenoid valve selection.

Here are 114 pages of up-to-date valve information. These pages incorporate detailed engineering sections. Finding the proper valve for your particular application is made easy by a simple *master index* which leads you to a *separator* where you will find all the valves of the type you require. Each *separator* has a more detailed *index* which will enable you to turn right to the *valve bulletin* needed to meet your particular requirements.

Section 1.

GENERAL ENGINEERING INFORMATION

Expanded engineering data with diagrams, gives valve construction, operating principles, features. With nomographs using Cv ratings for valve sizing.

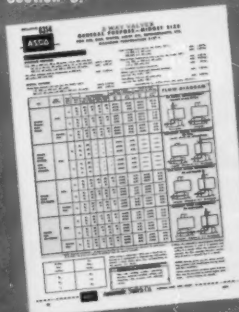

Section 2.

2-WAY VALVES

Covers all 2-way valves of the fully automatic type, for a wide range of pipe sizes and pressures.

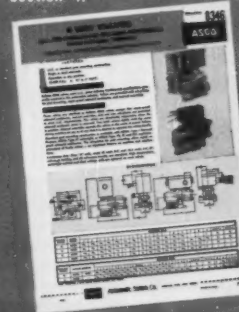

Section 3.

3-WAY VALVES

Detailed information on fully automatic valves for pilot control of diaphragms or cylinders, or for diverting flow in pipelines.

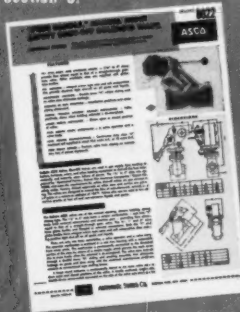

Section 4.

4-WAY VALVES

Fully automatic types covered. Both single and dual solenoid construction for general purpose and I.I.C. requirements.

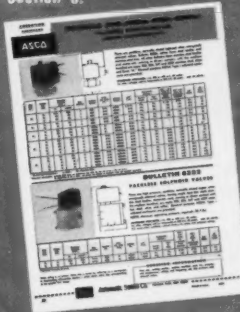

Section 5.

MANUAL RESET VALVES

2 and 3-way solenoid valves for safety shut-off applications.

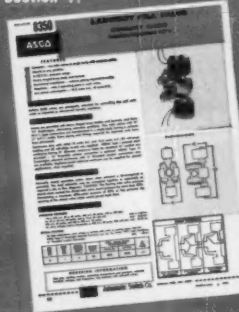

Section 6.

CORROSION RESISTANT VALVES

Includes 2 and 3-way solenoid valves for handling corrosive gases and liquids. Section incorporates a selection guide chart.

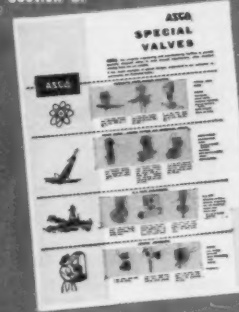

Section 7.

SPECIAL PURPOSE VALVES AND ACCESSORIES

Special purpose equipment: waterproof and explosion proof solenoids, laundry valves, cylinders, etc.

Section 8.

NUCLEAR VALVE DATA

Shows ASCO specialized solenoid valve designs for nuclear, guided missile, Navy and dispensing applications.

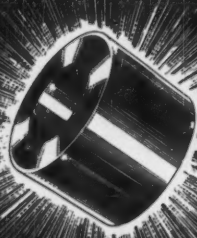

You may order the complete catalog or individual sections or bulletins. You will find easy to use return reply cards in each catalog for ordering additional literature. Also available is the Electromagnetic Control Master Catalog 57-S or any one of the six sectional Catalogs covering Automatic Transfer Switches, Remote Control Switches, Contactors, Relays, Solenoids or Electric Plant Controls.

Any of these important engineering reference aids may be obtained by writing Automatic Switch Company — on company letterhead only please.

Cold Heading Cost Savings

**Actual Cost Cuts
As High As 70%**

The most important consideration we can point out to the designer or purchaser of fasteners and small parts is that any part which can be machined from rod stock is also potentially available from the cold heading manufacturer. This technique offers speed of production, without scrap loss, plus superior strength and appearance for low cost and high design efficiency.

The designer need not be restricted to standard fastener sizes when they do not meet the requirements of his application. It is often much less expensive to specify a rivet, nail or screw to meet the task exactly as the application requires, than it is to compromise its function for the sake of "standards." While there is nothing mysterious about the cold heading process, experience has proved it to be of inestimable value for getting maximum quality and output at a minimum cost. While the really spectacular advantages in cost show up in runs of several thousand pieces, we are also able to take care of short run requirements. We welcome and expect manufacturers to come to us for advice and assistance concerning their fastener problems.

Given complete specifications, including a drawing and an idea of the application, we can quickly tell you whether or not it will be advantageous to have your fastener or part JOB-DESIGNED by HASSALL. The remaining important aspect of our service to you is the ability to get into production quickly and make prompt shipment.

Write for a copy of our new booklet, "What the Designer Should Know about Cold Heading".

Institute of the Aeronautical Sciences. 25th Annual Meeting to be held at the Sheraton-Astor Hotel, New York. Further information is available from IAS headquarters, 2 E. 64th St., New York 21, N. Y.

Feb. 2-7—

American Institute of Electrical Engineers. Winter General Meeting to be held at the Hotel Statler, New York. Additional information can be obtained from institute headquarters, 33 W. 39th St., New York 18, N. Y.

Feb. 4-6—

Society of the Plastics Industry Inc. 13th Annual Technical and Management Conference of the Reinforced Plastics Div. to be held at the Edgewater Beach Hotel, Chicago. More information is available from society headquarters, 250 Park Ave., New York 17, N. Y.

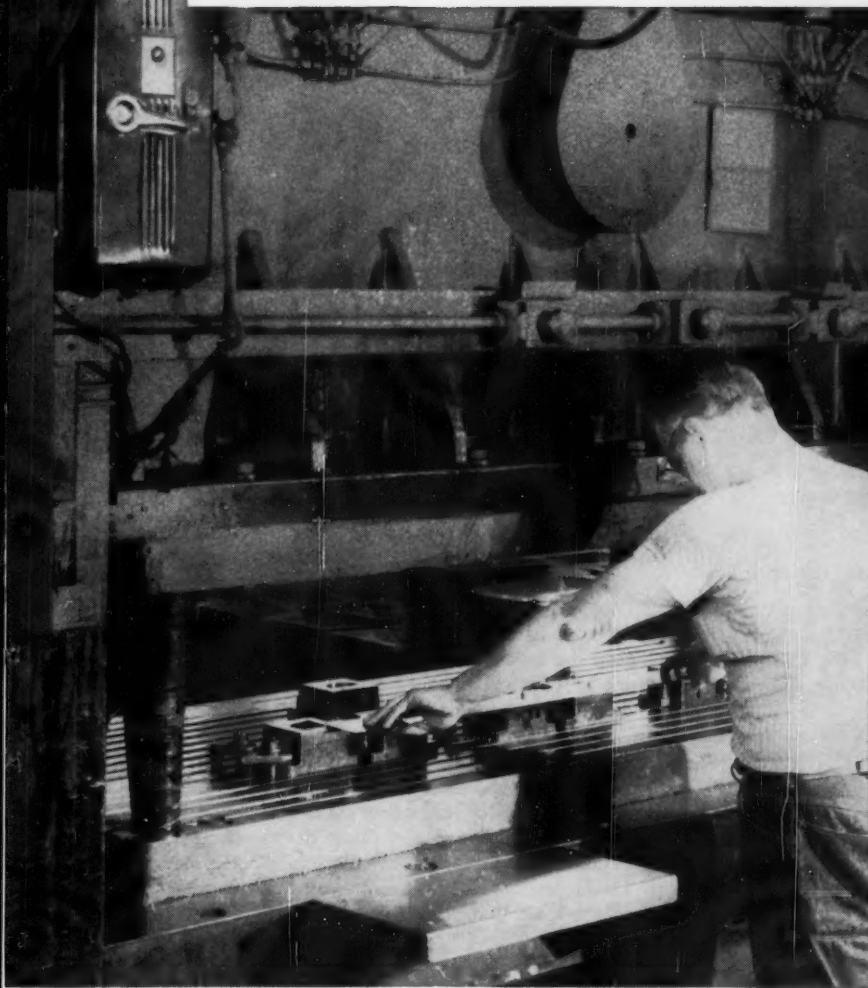

Feb. 13-15—

National Society of Professional Engineers. Spring Meeting to be held at Michigan State University, East Lansing, Mich. Further information is available from NSPE headquarters, 2029 K St. N. W., Washington 6, D. C.

IMPROVE MACHINE TOOL PERFORMANCE

—with Westinghouse components

...ready today

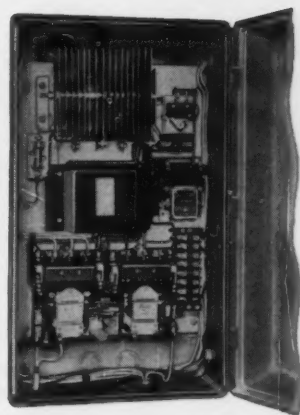

Stamping press performance improved at this plant when they used Westinghouse DYNAC braking control to reduce stopping time 95 percent.

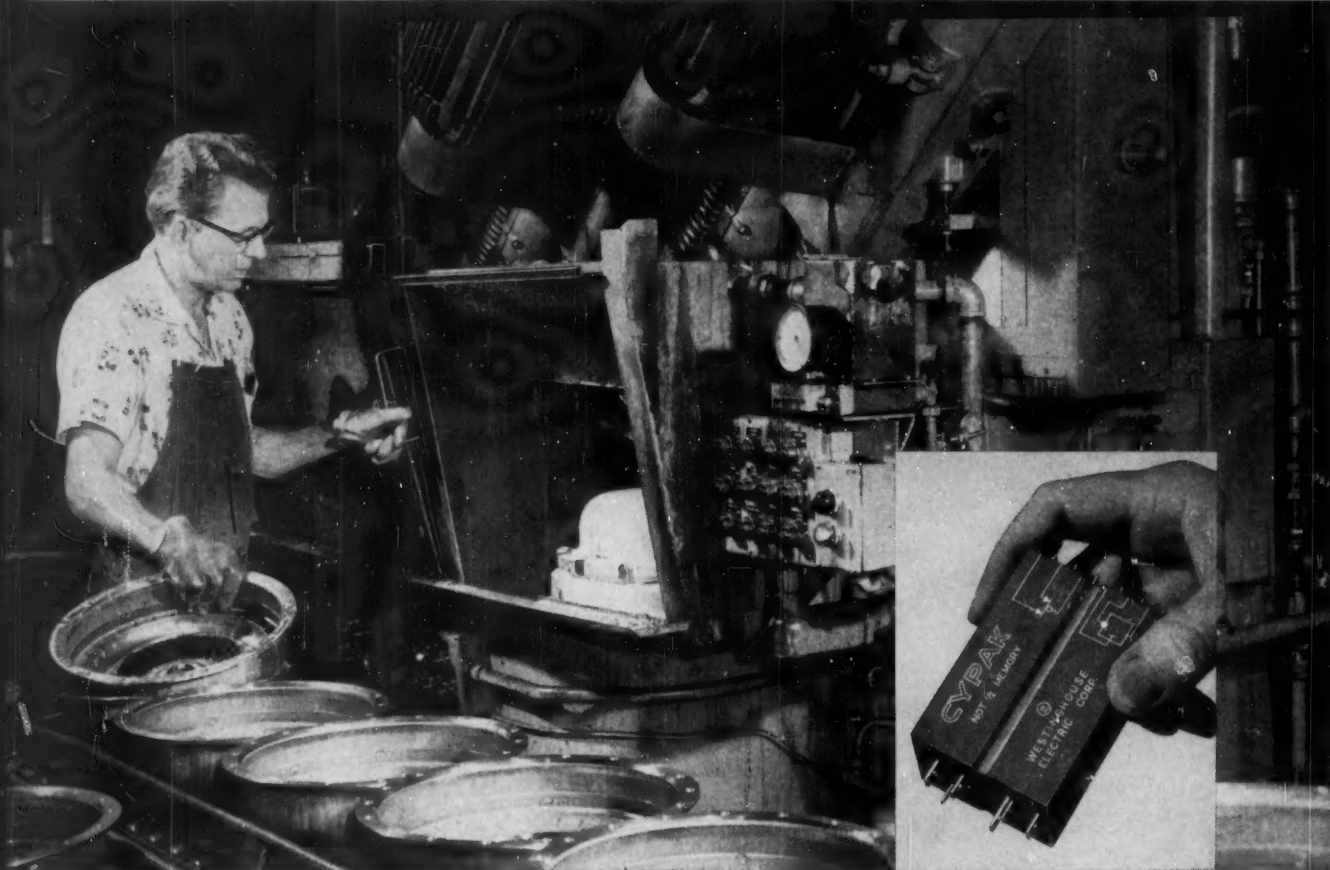

MP-3057-1

YOU CAN BE SURE...IF IT'S Westinghouse

Circle 430 on Page 19

Westinghouse Cypak static control reduces maintenance costs in form-grinding automotive transmission parts.

THESE COMPONENTS OFFER IMMEDIATE ANSWERS

...for more dependable operation

...for quicker stopping...for faster duty cycles

You don't have to wait for electrical answers in making machine tool improvements or modifications. Outstanding design and improvement in Westinghouse control components, systems and drives help designers and their customers to act now.

For example, *Westinghouse DYNAC® braking control*, cover photo, reduces press stopping time 95 percent. The eight minutes it previously took to stop the heavy flywheel on this press have been cut to just 24 seconds with DYNAC. This operation is now getting the fastest, smoothest stops possible to increase production.

Cypak static control*, above, has already outlasted conventional relays previously used on form grinders at a large automobile manufacturer's plant. No down time for control maintenance has been necessary on this highly repetitive operation in over 17 months.

*Trade-Mark

Westinghouse Life-Line® "H" Motors, right, make possible faster, smoother reversing cycles to save production time. Westinghouse reduced armature inertia up to 55 percent and increased commutating ability 35 percent to provide in the Life-Line "H" Motor the fastest d-c motor response available to improve machine tool performance.

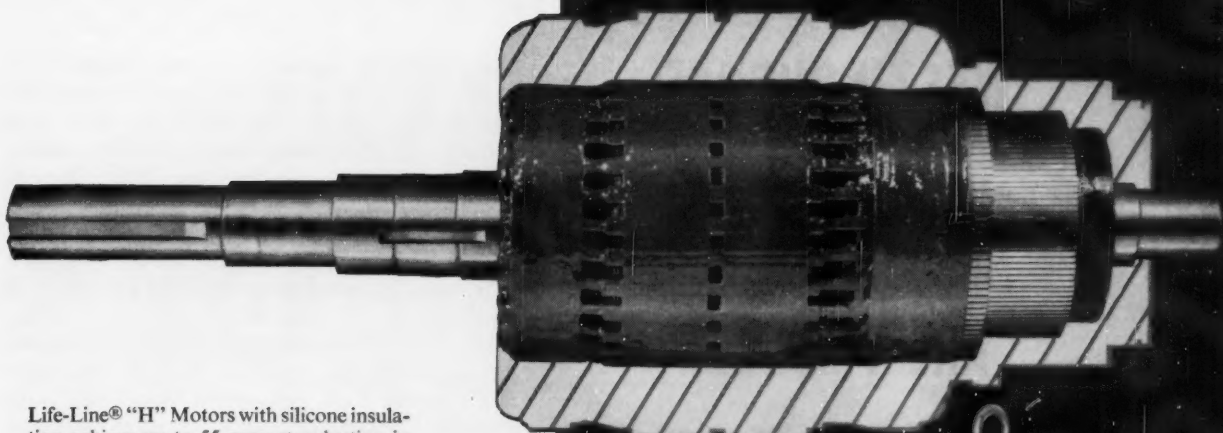

Westinghouse right-angle gearmotor, right, delivers up to 195 percent more torque capacity than conventional single-reduction worm gearmotors between 9:1 and 60:1 speed reduction ratios. It's the result of more efficient, double-reduction gear train. You'll find Westinghouse packaged motor-reducer drives offer rugged dependability, too, for improved machine performance.

Developments like these help you design and build machine tools that answer your customers' needs for increased productivity at lower cost. Whatever the function you want performed... sensing, transmitting, recording, computing, control or driving... think of Westinghouse components first!

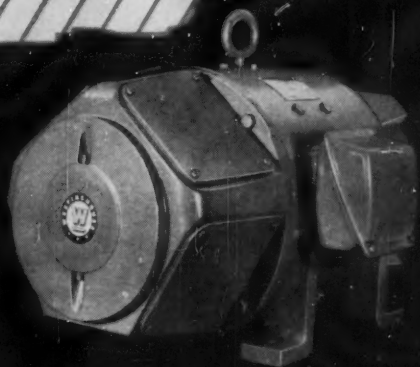

MP-3057-2

YOU CAN BE SURE...IF IT'S Westinghouse

Life-Line® "H" Motors with silicone insulation achieve up to 55 percent reduction in armature inertia by reducing armature size, as shown by the silhouette above. New controlled ventilation system makes this reduction possible. With commutating ability increased 35 percent, the Life-Line "H" assures faster reversing performance.

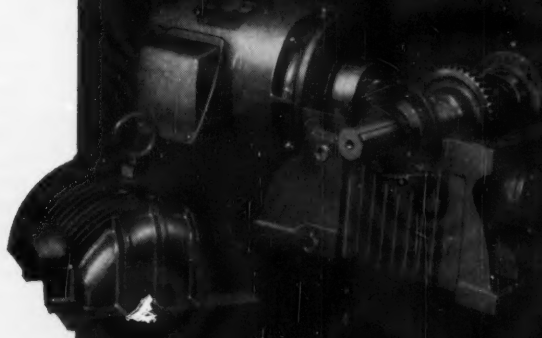

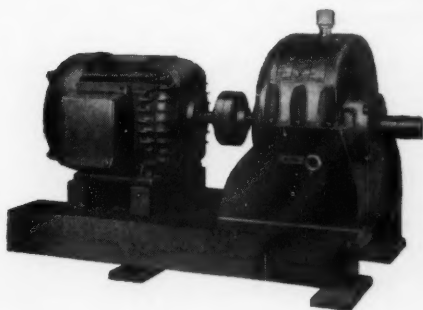

Push-lite pushbuttons combine the functions of both a pushbutton and indication light in one unit. One push transmits the signal and energizes the indicating light. Push-lites are oiltight—part of the complete Oil-Tite® line of 1,500,000 pushbutton control arrangements available from stock.

*Trade-Mark

Either Westinghouse gearmotors or packaged motor-reducer drives save design time with a wide selection in horsepower, speed ratios, direction of power take-off, mounting and coupling methods.

MP-3057-3

WESTINGHOUSE SERVICES AND FACILITIES ARE FLEXIBLE

HELP YOU FROM

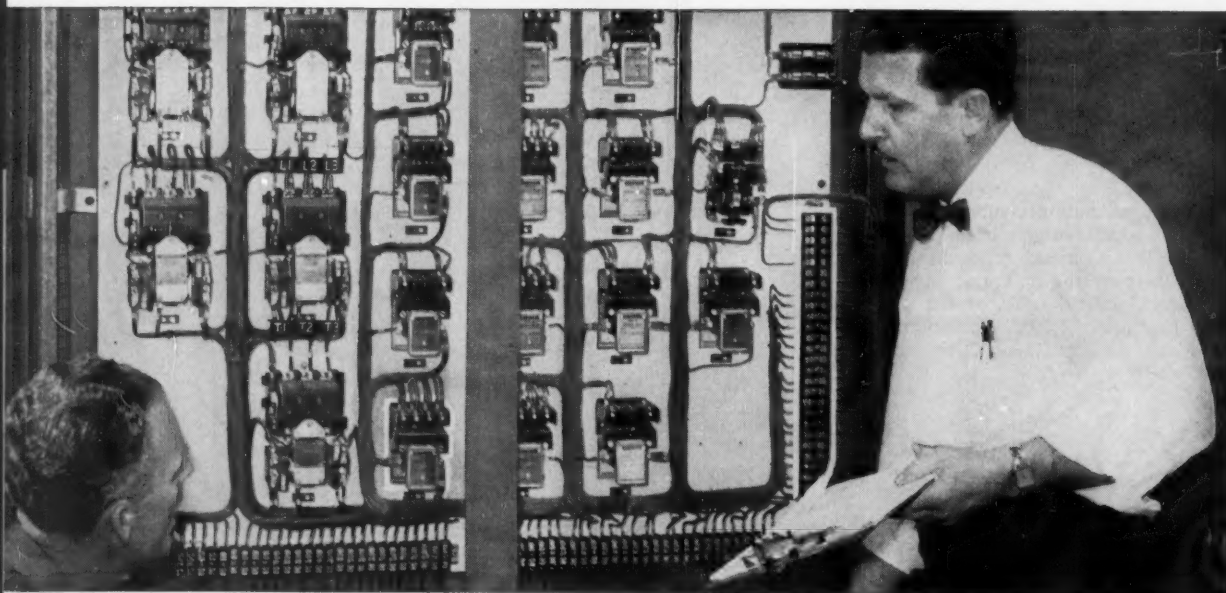

DESIGN BOARD TO TEST FLOOR

Add experienced manpower to your machine tool projects by simply calling your local Westinghouse representative. Whether you have a problem in drive system design, in component development or in manufacture and assembly, Westinghouse facilities provide economical ways to get the answer on schedule.

Westinghouse research . . . field engineering service . . . local manufacturing and repair plants . . . renewal parts stocks . . . are all ready to extend you service in any situation.

And when you select Westinghouse components, your customers will recognize electrical leadership. You'll benefit from one-supplier responsibility for products of outstanding quality, backed by more than 70 years of electrical experience. Westinghouse Electric Corporation, 3 Gateway Center, P. O. Box 868, Pittsburgh 30, Pennsylvania.

RACINE®

SLEEVE TYPE VALVES GIVE BETTER CONTROL

Proper control of oil flow improves the operation of your machines.

RACINE Sleeve Type Valves are designed with round drilled parts that assure smooth, control of oil to cylinders and fluid motors.

These RACINE Valves are provided with dust-proof solenoid covers — a pending patent includes a RACINE feature that prevents solenoid operation and injury to operator when covers are removed or loose.

Built to J.I.C. specifications RACINE Valves are approved for use in all critical applications. They are precision-built, compact, and rugged in design. Operating pressures to 2000 psi with full back pressure on exhaust port.

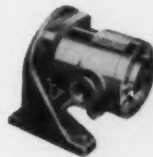

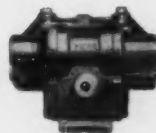

Your machine will operate better, with less maintenance because of longer life of RACINE Sleeve construction. Write today for complete catalog showing why "Sleeve Type Valves give Better Control."

Can a man be an expert in everything?

IT'S SAD BUT TRUE that the product design engineer of today has to be a many-faceted expert. He has to be an engineer *and* a materials expert *and* a production expert. He has to be well up on purchasing fundamentals, plus the elements of cost accounting.

There is one design responsibility from which we can give you some relief, though. That is the selection of springs. Spring design is a field unto itself, and, although we'll be glad to give you mountains of interesting information on the subject, why concern yourself with it? We'll do the work for you.

AS&W spring engineers will gladly work with you to select the right combination of spring characteristics that will do the job well. Most important: they may be able to suggest a slight design change that will drastically lower the *cost* of the spring.

Just call your nearest AS&W representative.

Vickers Magneclutch for Better Torque Transmission . . .

Magneclutch®

**solves difficult
tension control problem
in slitting machine
operation**

This specialized machine by Gude-man Company of Chelsea, Michigan, slits mil-thick materials such as paper and metal foil for use in capacitors.

As the feed roll is unrolled, slit and rewound, the tension on the material as it passes through the slitting knives and rollers must be accurately controlled, to assure uniform rewinding and to prevent strains, breakage or snarling.

The manufacturer was able to obtain this necessary tension control independent of speed only with the Vickers Magneclutch, after mechanical clutches had failed because of changing characteristics and difficulty in adjusting to changing tension demands.

This, of course, is only one of many practical uses for the Magneclutch, the magnetic particle clutch that provides smooth operation without grab or chatter, torque at zero slip, fast response, and long life because there's no wear on torque transmitting surfaces.

*Write for complete information
and literature.*

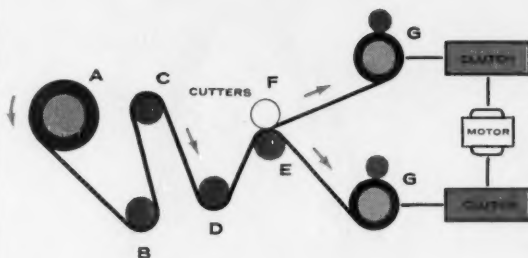

VICKERS INCORPORATED

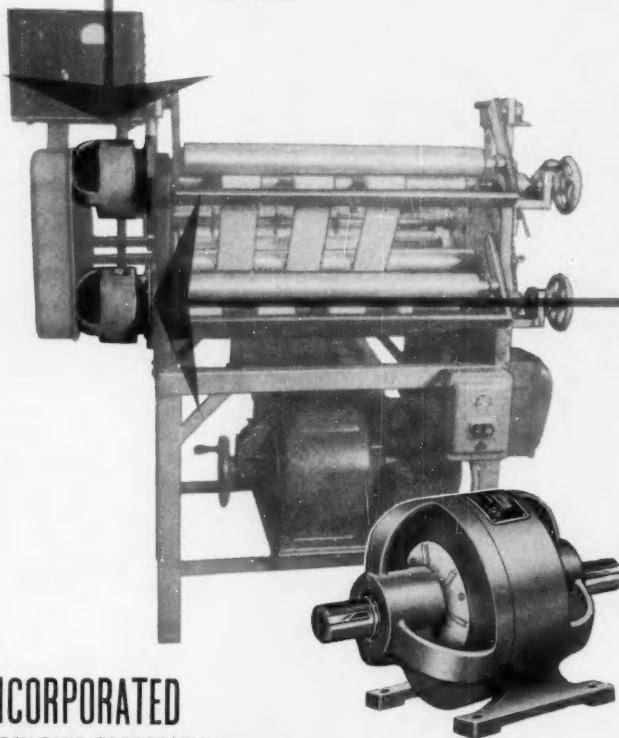

DIVISION OF SPERRY RAND CORPORATION

ELECTRIC PRODUCTS DIVISION

1881 LOCUST STREET • SAINT LOUIS 3, MISSOURI

Rollers B, C and D pull the material from the unwind roll and establish the speed at which the material flows through the machine. The torque transmitted by the Magneclutch establishes the tension in the material between roller D and roller G. As the diameter of the windup roll increases, the clutch slips automatically, permitting the material to wind up at a constant speed and tension.

WORTHINGTON QD SHEAVES — THE ORIGINAL 2-PIECE DESIGN

EASY ON!

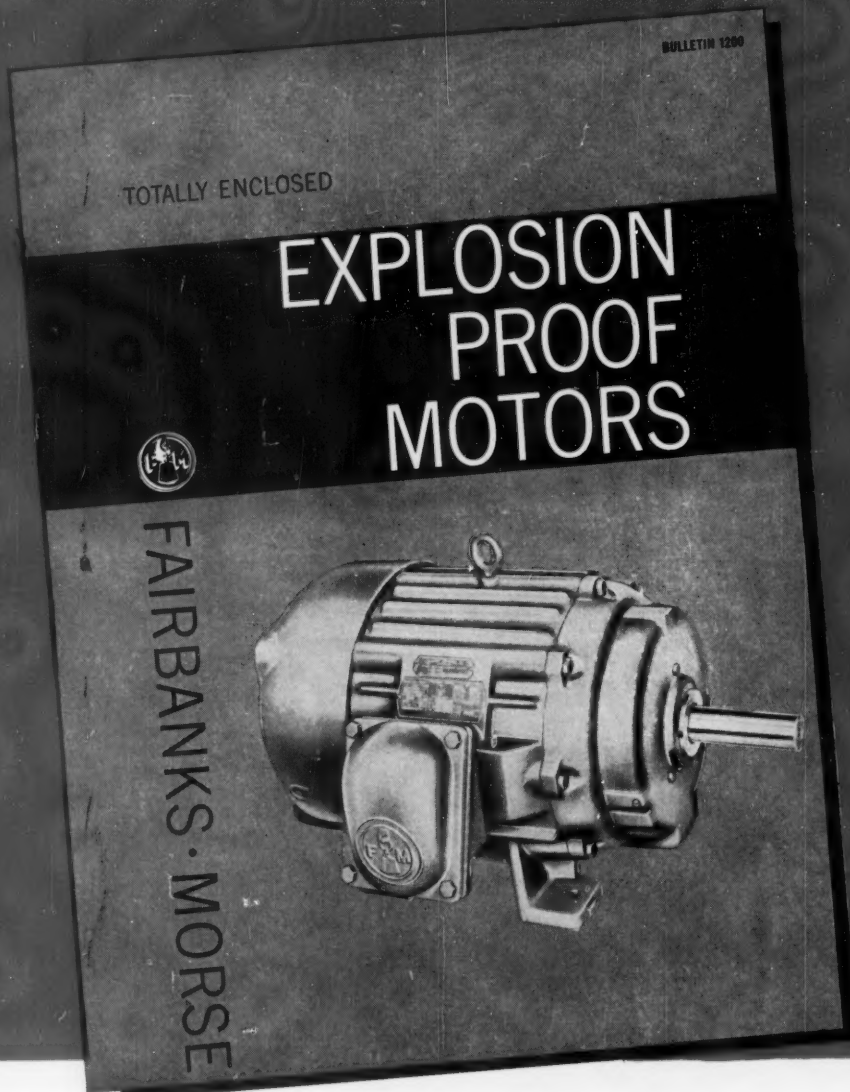

Only Worthington QD sheaves have the exclusive two-piece design that lets you install the sheave *one part at a time*. No heavy rim and hub combination to delicately inch into place. The QD's tapered hub slides easily on the shaft, locks with a cap screw for permanent alignment. A set screw locks the key in place. Sheave pulls up tight with heat-treated bolts.

WORTHINGTON

ELECTRIC MOTORS AND GENERATORS • DIESEL LOCOMOTIVES AND ENGINES • PUMPS • SCALES • RAIL CARS • HOME WATER SERVICE EQUIPMENT • MAGNETOS

WORTHINGTON QD SHEAVES — THE ORIGINAL 2-PIECE DESIGN

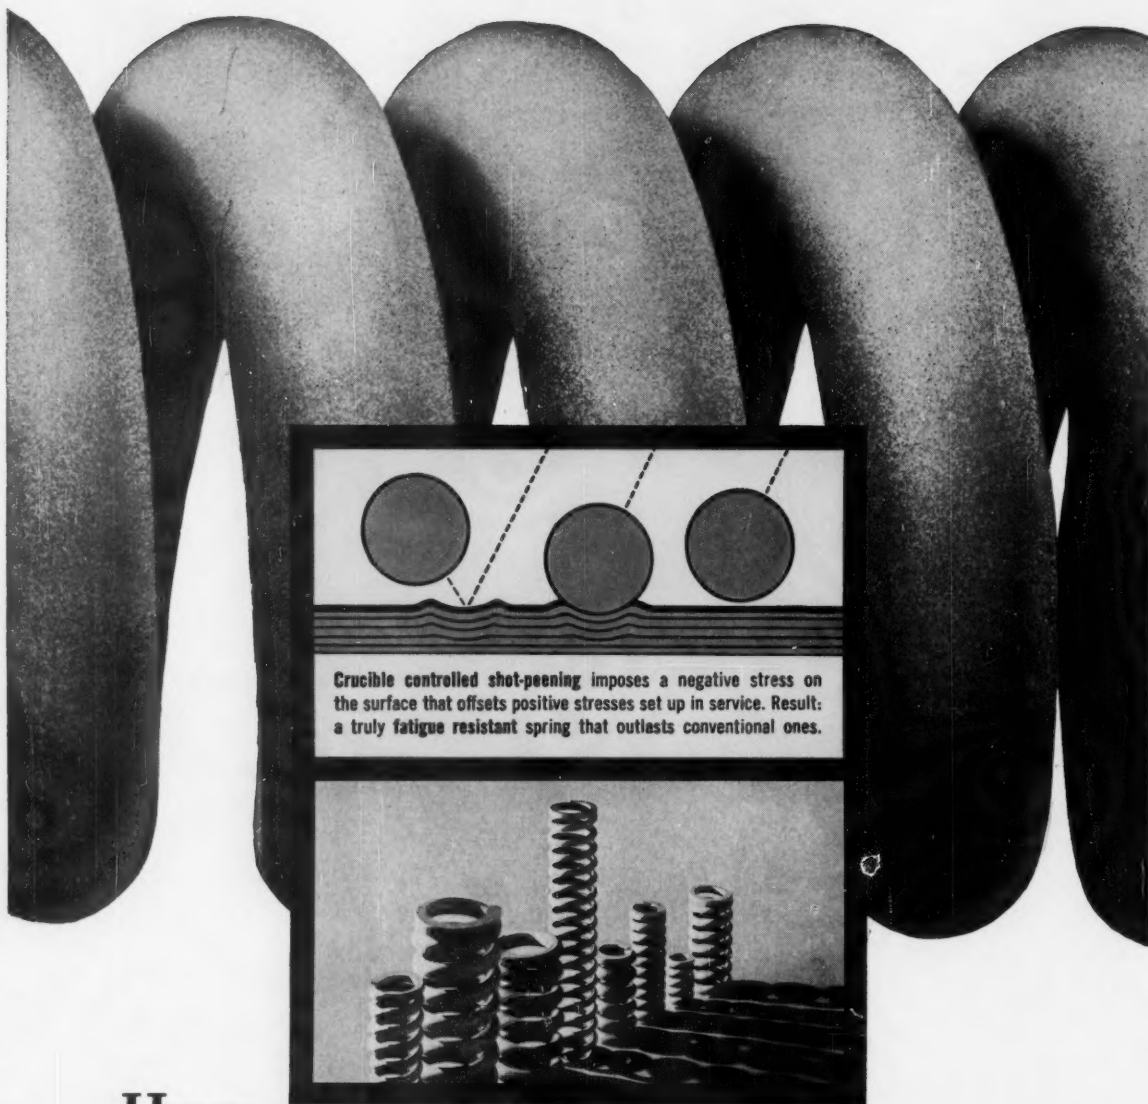

Rim slips off hub—not shaft

EASY OFF!

Loosen the big bolts, use two for jack screws and the sheave practically comes off by itself! To change speed it's a simple matter to mount a larger or smaller sheave on the hub which remains aligned on the shaft. This easy on, easy off feature is the big advantage of Worthington QD sheaves—the only design that lets you install or remove one part at a time.

WORTHINGTON

Crucible controlled shot-peening imposes a negative stress on the surface that offsets positive stresses set up in service. Result: a truly fatigue resistant spring that outlasts conventional ones.

How CRUCIBLE FATIGUE RESISTANT SPRINGS are made stronger to last longer...

First, every Crucible *fatigue resistant* industrial spring is shot-peened. It's the best way to insure high fatigue resistance under rugged operating conditions. And it makes the spring stronger by eliminating stress concentration points that could lead to spring failure.

But, most important, Crucible gives you full measure of the two factors upon which good springs depend: good spring design, and fine steel.

In addition to Crucible's staff of proven spring designers and spring makers is Crucible's years of experience in fine steel making—from ore to finished spring. When you have a spring application, let an experienced Crucible spring specialist suggest the best spring for it. And write for a free copy of the "Handbook of Coil Spring Design". Spring Division, Crucible Steel Company of America, McCandless Avenue, Pittsburgh 1, Pa.

CRUCIBLE spring division

Crucible Steel Company of America

WORTHINGTON QD SHEAVES — THE ORIGINAL 2-PIECE DESIGN

Severe
shocks
cannot
loosen it

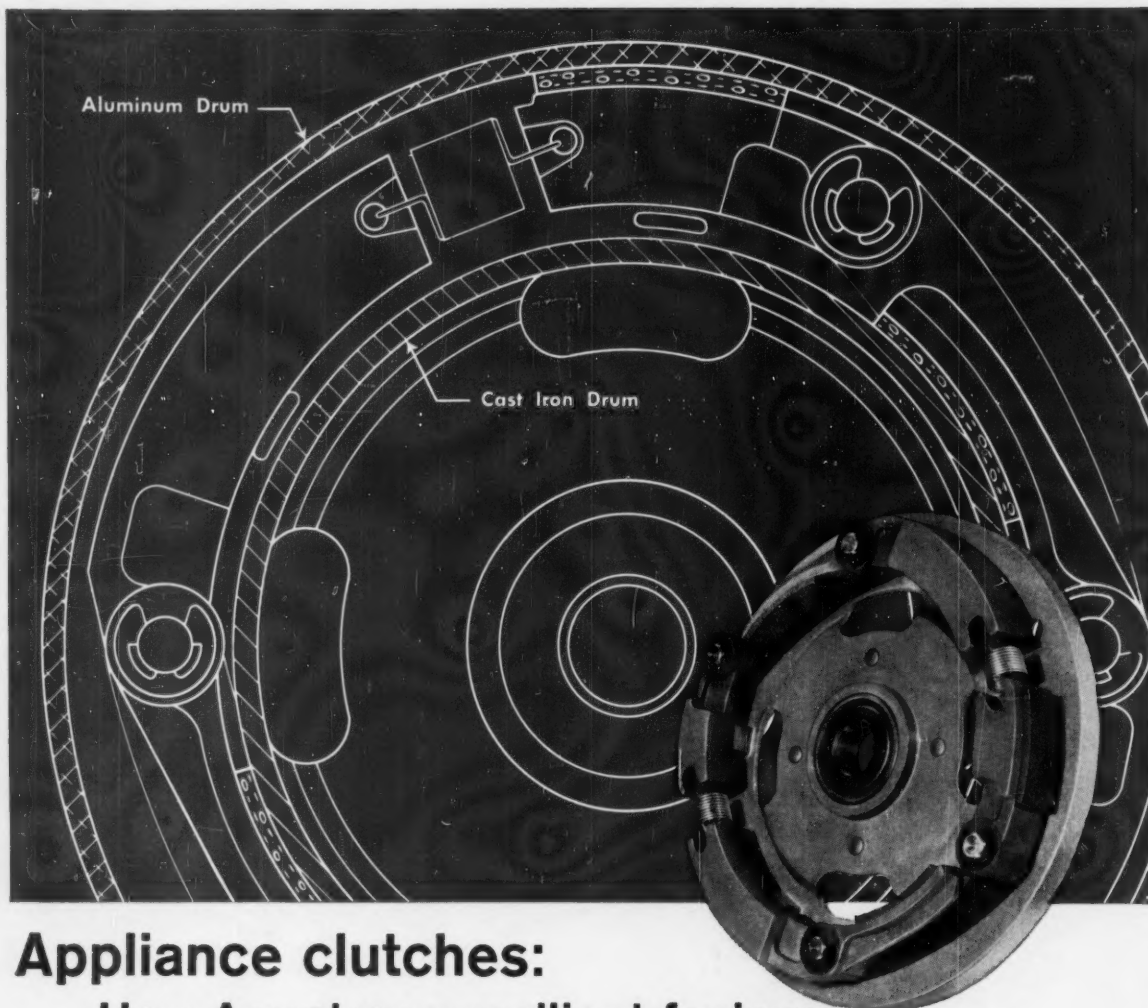

ALWAYS TIGHT!

Severe shock overloads or reversing applications cannot loosen a Worthington QD sheave. The secret is the two-piece construction with the vice-like grip. Tightening the pull-up bolts forces the tapered hub to securely lock the shaft as tight as if the sheaves were integrally cast with the shaft (comparable to a press fit.) To keep the key from drifting, the set screw—another Worthington exclusive—anchors it in position.

WORTHINGTON

Appliance clutches: How Armstrong resilient facings cut costs and extend service life

Five resilient facings with a total area of less than three square inches helped General Electric reduce unit cost and increase service life of the clutch in its two-speed Filter-Flo* washers.

Four of these facings are attached to the carrier plate shown above and engage centrifugally. For this application, General Electric engineers wanted a material with a high coefficient of friction to provide positive engagement under minimum closing pressure. In addition, it had to be a material that could be depended upon for years of trouble-free performance.

Armstrong NC-733 met these requirements and reduced costs as well. The fifth facing, when activated by a solenoid, engages the rim of the carrier plate, putting the clutch in "low." Here, NC-733 created the necessary holding torque under so little pressure that

a small, inexpensive solenoid and linkage system could be used.

In thousands of General Electric Filter-Flo washers, Armstrong NC-733 friction material is now helping to provide efficient clutch operation.

This is one of many Armstrong resilient facings being used in hundreds of applications—from sensitive laboratory instruments to earth-moving equipment. Perhaps one of these materials can cut costs and improve performance in your product.

Send for free booklet

A new booklet describing our full line of resilient facings will soon be available. Write today and reserve your copy of "Armstrong Resilient Friction Materials." Address Armstrong Cork Company, Industrial Division, 7212 Dean Street, Lancaster, Pennsylvania.

Announcing—the new, improved

New sturdier construction! New heavier jacket! Improved Sealtite* E.F. offers new superior performance in equipment . . . new installation ease. No extra cost!

Sealtite Type E.F.†—the original flexible, liquid-tight conduit, first to meet J. I. C. standards—is now better than ever. New design has made it stronger, tougher, more durable in service . . . easier to install.

Over-all construction is improved. Heavier extruded

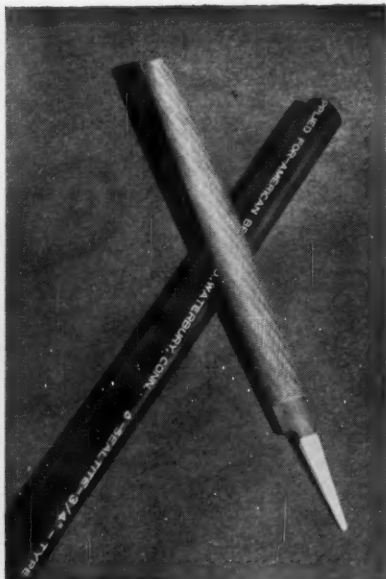

PVC jacket offers greater resistance to abrasion, cutting and tearing . . . greater oil resistance . . . greater holding power for fittings.

It is more flexible—permits smaller bending diameters. New convenient markings save time, prevent waste. Length is indicated by arrows at 1-foot intervals. Trade size in inches is also shown on cover.

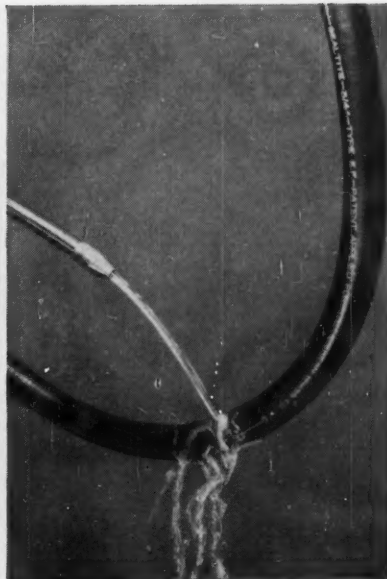

Available in handy cartons, or nonreturnable reels,

STRONGER. Over-all construction is stronger, more durable.

TOUGHER. Thicker PVC jacket resists abrasion, cutting, and tearing.

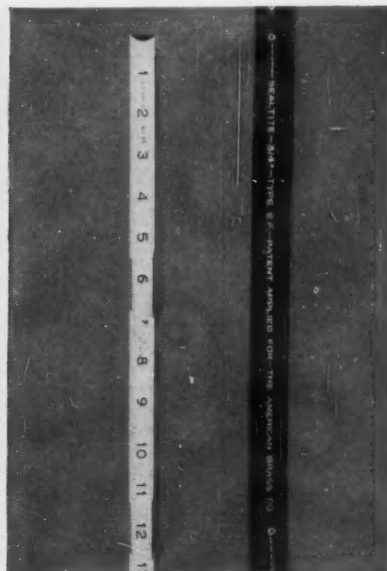

MORE OIL RESISTANCE. Liquid-tight jacket keeps out all foreign matter.

GREATER HOLDING POWER FOR FITTINGS — easier attachment.

GREATER FLEXIBILITY — smaller bending diameters — smoother cover even when flexed.

NEW MARKINGS — length and trade size are indicated at 1-foot intervals.

Sealtite E. F. flexible, liquid-tight conduit

at no extra cost. Reels simplify handling and cutting, reduce scrap, simplify storage, have handy charts for a running inventory.

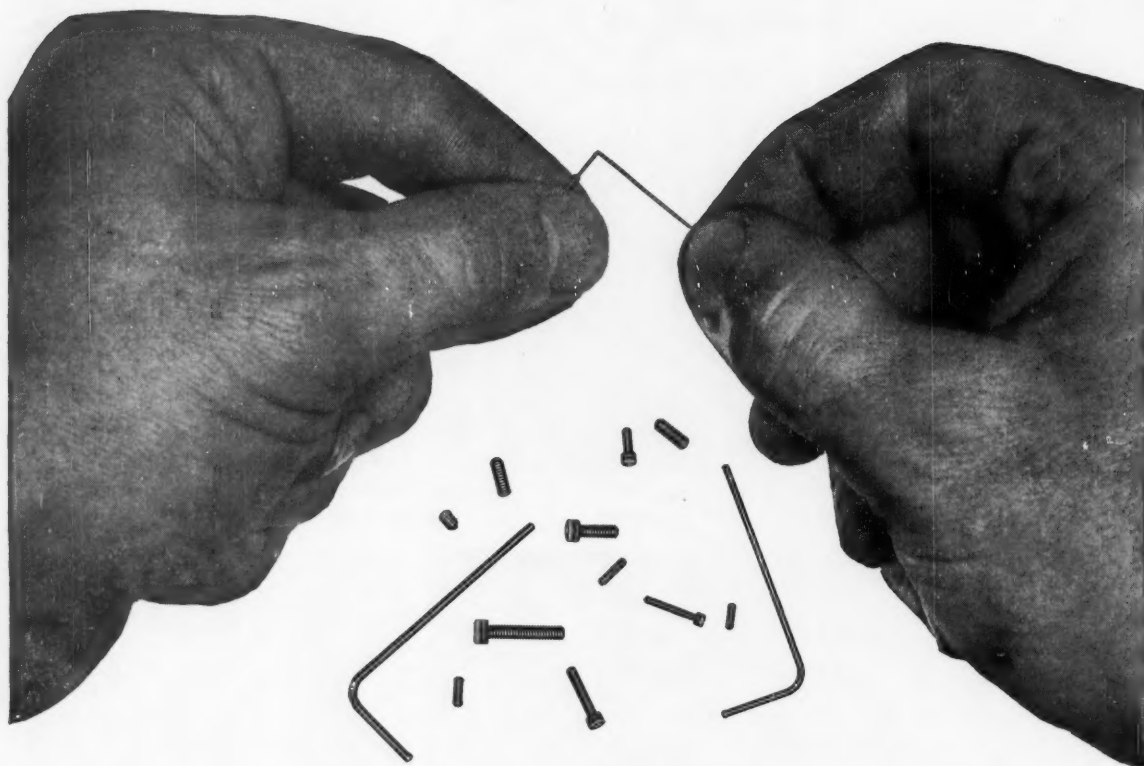

Sealtite types E.F. and U.A. (U.A. is approved by Underwriters' Laboratories) in both black and machine tool light gray. For information, write: The American Brass Company, American Metal Hose Division, Waterbury 20, Conn. *Trademark *Pat. Applied For 57199

SEALTITE

an **ANACONDA**® product

If you're miniaturizing . . . you'll save space, time and money with Allen Minicaps and Minisets (#0 thru #3 dia.)

These miniature Allen Hex Socket Cap and Set Screws will let you scale down your product sizes even farther. They're made from Allenoy special alloy steel—so strong that you can safely specify fewer screws or smaller sizes.

Allen Minicaps and Minisets are tiny, but very tough!—true Allens, with deep, clean, strong sockets and uniform Class 3A threads. Minicaps have the Allen knurled "Grip-Head" and are trimmed both on top and under the head, for tighter fit and better appearance. Minisets have the improved

small-cup Allenpoint that drives deeper and holds tighter.

Because sockets are uniformly true hexagon shape, the key or driver fits tight—makes starting much easier, saves a lot of time in assembly.

Diameters of these miniatures run from #0 through #3. Minicap lengths run from $\frac{1}{8}$ " through $\frac{1}{2}$ ", and Miniset lengths from $\frac{1}{16}$ " through $\frac{1}{4}$ ". Also standard in stainless steel. Your Industrial Distributor has them now. He'll show you why these Allens—like all Allens—hold tighter and last longer. Or write for information and samples.

Use Minicaps and Minisets wherever you need dependable fastening in very small assemblies:

TV, radio and telephone equipment • Guided missiles, rockets
• Panel meters • Electro-mechanical devices and servo-systems • Computers • Control and operating mechanisms for relays
• Cameras • Instruments

STAINLESS STEEL MAKES THE DIFFERENCE

...its effect on the
sale of new designs

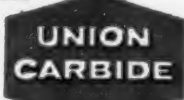

Designers gain prominence through the effectiveness and saleability of their work. The sales appeal of stainless steel is a powerful tool for selling new designs. It has turned many design ideas into profitable products.

The recognized merits of stainless steel, such as strength and corrosion resistance, make it equally "right" for housewares, jet engine parts, or chemical equipment. These qualities plus a variety of finishes have put stainless into planes, trains, cars, cafeterias, and scores of other places.

For more facts about stainless steel see your supplier. For a free copy of "Stainless Steel in Product Design" write: ELECTRO METALLURGICAL COMPANY, Division of Union Carbide Corporation, 30 East 42nd Street, New York 17, N. Y.

B.F. Goodrich Rivnuts®

New Seal-Head Rivnut simplifies integral wing tank assembly

GRUMMAN ENGINEERS wanted to use integral wing tanks to stretch the range of their F11F-1 Tiger. Fuel tank walls would be the single top and bottom aluminum skin panels that form each wing. The problem was to find a blind fastener that could join the wing sections tightly enough to withstand the strains of supersonic flight and still prevent loss of fuel.

Working with Grumman, B.F. Goodrich engineers solved the problem by developing a Seal-Head Rivnut with rubber "O" ring, approved for primary structure. The cross section above shows how it works.

The new B.F. Goodrich Seal-Head Rivnut is a precision-ground steel fastener with high tensile strength. Installed in a drilled and countersunk hole, the Rivnut actually rivets the sections together. The "O" ring makes a fuel-tight seal and withstands temperatures from -65° to 225° . Then a special screw, available in tensile strengths up to 165,000 p.s.i., is screwed into the Rivnut to further reinforce and secure it against strain and vibration.

Whatever your fastening problem, write Department MD-127,

MICRO SWITCH Precision

... FIRST IN PRECISION SWITCHING

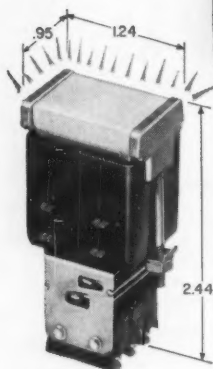

Here are **5 NEW**
Series of Precision Switches
by MICRO SWITCH...

Designed to meet modern electrical
control requirements

*MICRO SWITCH pioneered the development of
precision switches... It has been first in precision
switching for two decades... These new switches are
typical of MICRO SWITCH's continuing leadership.*

NEW!

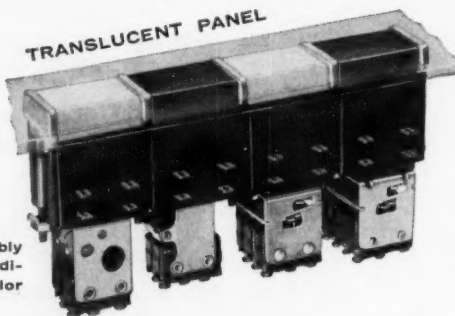

LIGHTED PUSHBUTTON SWITCHES

Typical switch module
(a 3-circuit design)

ANOTHER **FIRST** BY MICRO SWITCH

A typical compact assembly
of switches in panel slot. Indi-
cates choice of button color
and number of circuits.

- LARGE, EASILY ENGRAVED BUTTONS...
- EASILY INSTALLED IN COMPACT ASSEMBLY
- THREE TYPES OF ILLUMINATED SIGNAL
- WIDE CHOICE OF CIRCUITRY

MICRO SWITCH Series 100PB Lighted Pushbutton Switches provide a neat, good looking panel. Their compact mounting allows more switches per panel.

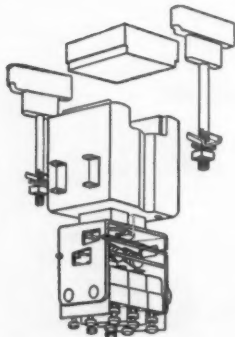

Because separate terminals are provided for each lamp and for each element of the contact structure, these switches permit intermixing of voltages, a-c or d-c current and even combinations of opposing polarities.

Three types of illuminated signals are provided: (1) one-color buttons,

combination) and (3) choice of either of two colors—neither of which is visible when button is not lighted.

Buttons are large enough to allow two lines of clearly legible engraving. The switch assemblies are easily mounted, either individually or in strips, by cutting a single slot in the panel.

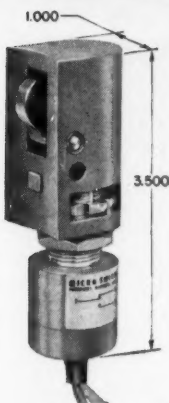

Matching indicating lamp assemblies are available with the same button and lamp combinations and same means of mounting as the complete 100PB switch assembly.

Exploded view Series 100PB
switch showing button and
mounting means.

(Send for Data Sheet 143)

Switches have uses unlimited

NEW!

MICRO SWITCH

"Rocket Switch"—

a rugged, sealed small switch for indicating and lockout devices

Developed for use on rocket launchers, this MICRO SWITCH 21AS2 assembly fits the needs of many industrial designs.

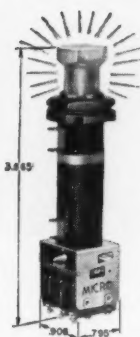

The assembly consists of one SPDT Type-EN switch attached to a rugged cam-type actuator. The assembly is environment-proof and withstands the highly-corrosive effects of rocket propulsion gases. The assembly will withstand heavy impact hammer blows on the actuator.

(Send for Data Sheet 120)

SWITCH CHARACTERISTICS

Operating force—6 to 12 lbs. Full overtravel force—10 lbs. min.; Release force—4 lbs. min.

Electrical Data: 28 vdc rating; inductive, 3 amps. at sea level and 2 amps. at 50,000 feet; resistive, 4 amps. at sea level and 50,000 feet; inrush, 24 amps. at sea level and 50,000 feet. Motor, 4 amps. at sea level and 50,000 feet; inrush, 24 amps. at sea level and 50,000 feet. (Altitude ratings established with seal deliberately broken.)

NEW!

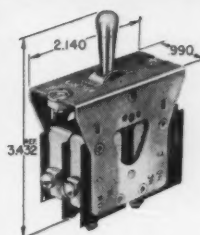

MICRO SWITCH Magnetic Hold-in Lighted Pushbutton Provides Three Functions

MICRO SWITCH lighted pushbutton switch combines the functions of a three-pole double-throw pushbutton switch, indicating light, and holding

relay into one compact unit which panel mounts on one-inch centers, both horizontally and vertically. Thus, the cost, wiring, maintenance and added space of these separate components are eliminated . . . A 28-volt dc solenoid is incorporated into the switch shaft. After the button is manually operated, the solenoid holds the switches in the operated position until electrically released. This feature gives the designer complete freedom in panel layout by eliminating the restrictions found in conventional mechanical release designs. (Send for Data Sheet 128)

SWITCH CHARACTERISTICS:

Operating force—35 oz. max. Pretravel—.050 in. approx. Total travel—.090 in. max. Three subminiature switches are SPDT.

NEW!

MICRO SWITCH three-position

toggle switch—4 SPDT circuits with a single lever

MICRO SWITCH 115AT Series of toggle switches uses four SPDT switching units. Two units are actuated in each extreme toggle lever position. None are actuated when lever is in center position.

Many different combinations, however, may be obtained, including the make and break of circuits in all three lever positions.

Outstanding features of this series include the compact design, positively-driven switch actuators and sturdy construction. A safety catch guards against accidental movement of toggle lever. (Send for Data Sheet 134)

SWITCH CHARACTERISTICS

Electrical rating at 30 vdc: inductive—10 amps. at sea level, 6 amps. at 50,000 ft.; resistive—10 amps.; motor—6 amps. Basic units listed by Underwriters' Laboratories for: 10 amps. 125 or 250 vac; ½ amp. 125 vdc; ¼ amp. 250 vdc.

NEW!

MICRO SWITCH "typewriter" pushbutton switch for manual keyboard control

MICRO SWITCH 1PB81-T2 switch is ideal for one-finger rapid-repeat operation such as is required for the type of keyboard control found in electric typewriters, adding machines, etc. The repeat action is as rapid as the fastest operator can push the button.

This switch uses a SPDT MICRO SWITCH subminiature switch for snap-action reliability. The contoured button and unique overtravel spring combine to reduce operator fatigue. Operating "feel," however, is sufficient to avoid mistakes and false actuations.

Removable ½ in. dia. plastic button is available in red, green, off-white or black. It is keyed to prevent rotation. (Send for Data Sheet 125)

SWITCH CHARACTERISTICS

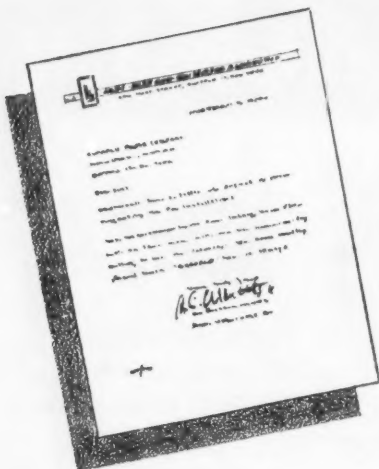

Electrical rating at 30 vdc: inductive—3 amps. at sea level and 50,000 ft.; maximum inrush—15 amps. Basic subminiature switch is listed by Underwriters' Laboratories at 5 amps. 125 or 250 vac.

We would like to say that we are very well pleased with the "Buffalo" Fans we are using on our tunnel kiln installations. The "NV" Propeller Fan which Buffalo Forge designed for us for our drier operation is undoubtedly the best fan of this type we have used.

— from a leading manufacturer who builds "Buffalo" Fans into his products (name on request)

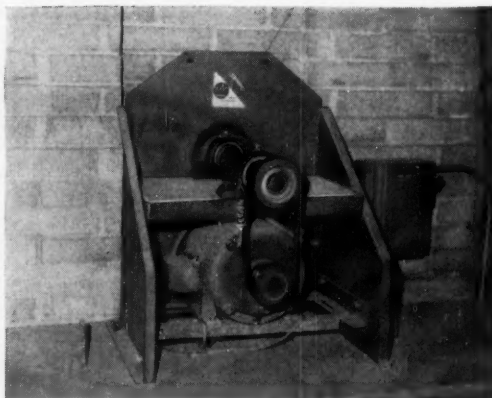

...and here's why

"BUFFALO" FANS WILL SUIT YOU, TOO

- HIGH EFFICIENCY
- STABLE PERFORMANCE
- COMPLETE SELECTION
- "SPECIAL" FANS ENGINEERED-TO-ORDER
- QUIET OPERATION
- DESIGN FLEXIBILITY
- "Q" FACTOR* RELIABILITY

At left — "Buffalo" Type "DL" Fan moving 14,000 cfm waste heated air from Tunnel Car Kiln to dryer.

At right — One of 3 "Buffalo" Dryer Recirculating Fans on Car Kiln. "Buffalo" "NV" Propeller Wheel mounted on end of shaft projected thru kiln wall.

INQUIRIES CONCERNING YOUR AIR HANDLING PROBLEM ARE INVITED.

**The "Q" Factor — the built-in Quality which provides trouble-free satisfaction and long life.*

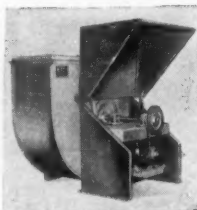

BUFFALO FORGE COMPANY

BUFFALO, N. Y.

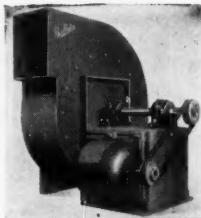

Canadian Blower & Forge Co., Ltd., Kitchener, Ont.

"Buffalo" Volume Fans for blowing, exhausting jobs up to 10" s.p., have moisture-proof cast iron housings, dust-proof ball bearings.

"Buffalo" Belted Vent Sets are light-weight "packages" for small-system ventilation. Highly efficient and quiet. Write for Bulletins.

"Buffalo" All-Welded Industrial Exhaustors handle any materials suitable for a pneumatic system. Heavy steel plate wheels and housings.

hoover locks lube in, dirt out for the lifetime of the bearing

Hoover is first to seal ball bearings with TEFLON! Hoover makes sure that lube stays in, dirt stays away from the smooth, mirror-like working surfaces of high quality *Micro-Velvet* Lapped Balls and *Hoover Honed* Raceways. You get greatly extended bearing life.

Why TEFLON for seals? TEFLON is the remarkable new product of chemistry . . . extra tough . . . extra long wearing . . . and so slippery that there is practically no torque resistance. Hoover seals are ingeniously engineered to maintain positive contact and improve lube circulation. Permanently attached full metal shields lock the seals within the bearing, safe from damage.

Use Hoover Ball Bearings with single or double seals of TEFLON for high speed applications, electric motors, or wherever periodic lubrication or maintenance is not practical, as in sealed units. They are available in both light and medium series.

*TEFLON is DuPont's Trademark for its Fluorocarbon Resins.
Micro-Velvet and *Hoover Honed* are Hoover Trademarks.

Note—Commercial and Military Packaging Engineers:

LINK-LOCK

...is the rugged answer to your exacting container closure problems

*LINK-LOCK plays
an important role
in the design
of this container*

Simmons' LINK-LOCK provides pressure-tight, impact-resistant closure, plus quick closing and opening, on this reinforced fibrous plastic product made by the new automatic pre-form process developed by Pressurform Container Corp. The two-section container will be used by the Light Military Electronic Equipment Dept. of General Electric Company for shipping airborne radar jamming units to the Air Force.

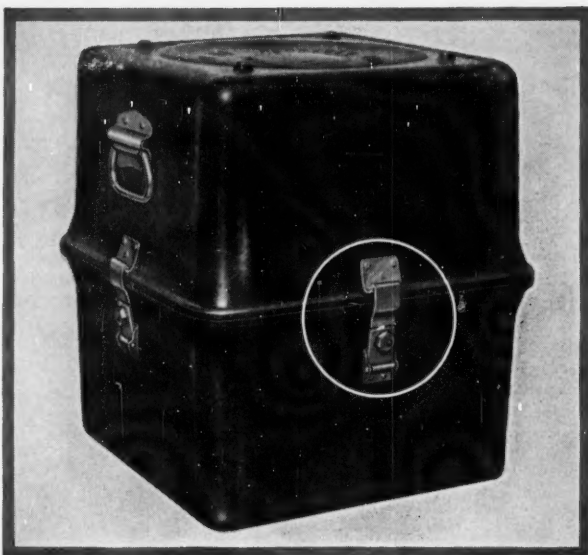

Of prime importance are the container's lightness, strength, rust- and mildew-resistance, ability to withstand high pressures without distortion, ease of locking and opening, and low cost.

Here's why LINK-LOCK is ideal for use on military cases produced to exacting specifications as well as on inexpensive commercial containers:

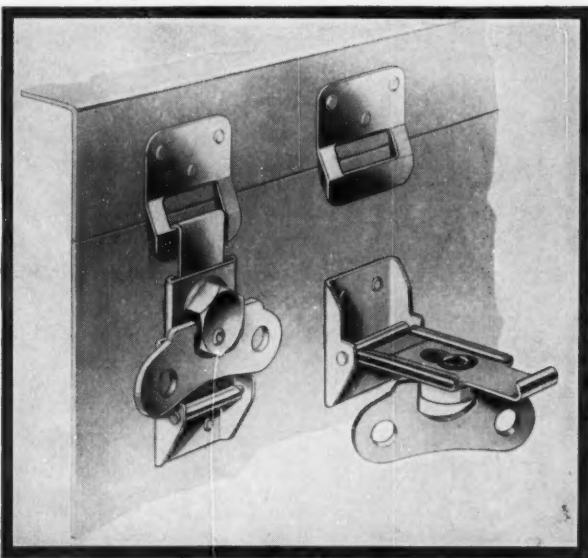

- High closing pressure with light operating torque...insures pressure-tight seals where required.
- Impact and shock resistant (positive-locking).
- Compact design...lays flat against case even when unlocked.
- Available in 3 sizes, for heavy, medium, and light duty.
- Opening and closing by wing-nut, screwhead, or hex nut.
- Flexible engagement latch design...can be varied to suit different conditions.

Also available! Spring-Loaded LINK-LOCK...ideal for less expensive containers where costs won't permit precision production. Spring provides take-up to compensate for set in gasketing, irregularities of sealing surfaces, and mounting inaccuracies.

Where does the versatile Simmons LINK-LOCK belong in your design? For full information and specifications, send for LINK-LOCK DATA SHEETS today. Samples and engineering service available upon request.

Courtesy of Pressurform Container Corp., and the LMEE Dept. of General Electric Co.

Each Valve

Hanna Flo-Pilot Valves are 1/4" two- and three-way Pilot Valves for air operation to 150 psi. They are used for remote control of master valves, directional control of small single acting cylinders and for shut-off. Same valve can be used for two or three-way operation either normally open or normally closed to inlet pressure.

HANNA Flo-Pilot Valves will deliver years of dependable performance at a very low cost because they have built-in money-saving features. Every Hanna Flo-Pilot Valve is equipped with a synthetic boot which seals the valve stem and internal parts from harmful dirt and abrasive, thereby eliminating the most common cause of valve failure.

These protective boots, efficient "O" ring spool packing and nylon sleeves, are built into every Hanna Flo-Pilot Valve to save you money and assure leak-free operation even after millions of cycles.

The five actuating-heads—push button, ball cam, hand lever, locking hand lever and mechanical link

clevis—are interchangeable in a matter of seconds. Spools can be changed just as quickly without disturbing the piping.

Corrosion resistant materials are used throughout. Flo-Pilot Valves have a simple, sturdy construction with anodized aluminum body, stainless steel and molded nylon parts. Valves can be conveniently mounted in any position and are furnished with brackets and fasteners. They are easy to operate, positive acting and have full capacity of 1/4" orifices.

Ask your Hanna representative (see the yellow pages or Thomas Register) for complete information or write direct for Catalog 262.

"Only *Carpenter* Stainless Tubing gives us failure-proof service"

The manufacturer of these four truly maintenance-free packless expansion joints (shown by arrows, above) has tried other stainless tubing, but says Carpenter Stainless Tubing is the "only one that renders failure-proof service".

These joints absorb thermal expansion, operating at pressures up to 210 psi and temperatures up to 650°F. They are typical of expansion joints made from Carpenter Tubing which operate at pressures up to 10,000 psi or temperatures as high as 1800°F. Once installed, they have never been replaced. Some have been in service over 15 years. The quality and uniformity of Carpenter Stainless Tubing contributed greatly to the trouble-free fabrication and maintenance-free service of these joints.

If an extra measure of quality in stainless tubing and pipe can improve your products or operation, call your Carpenter Distributor. He's your nearby source of better stainless tubing and pipe.

WHATEVER THE APPLICATION

you can improve your product with

GRAMIX[®]

(PRODUCT OF POWDER METALLURGY)

PRECISION FINISHED PARTS

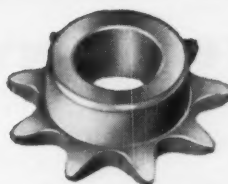

GRAMIX precision finished parts are improving products in virtually every branch of industry. A pump manufacturer, for instance, may specify a gasoline pump rotor made of GRAMIX and gain a number of advantages.

To begin with, the alloys are carefully blended to meet his individual requirements. The GRAMIX parts are then die-pressed to exact shape, sintered under rigid control and finished to tolerances as close as .0005".

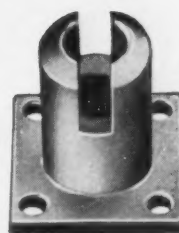

(This process, of course, costs far less than machining, forging or casting.) The manufacturer can expect the GRAMIX gasoline pump rotor to do a better job because all GRAMIX parts are precision engineered and precision controlled from alloying to finishing.

No matter what the application may be, GRAMIX parts fit specifications exactly. Parts may be impregnated with oil . . . to insure a longer life and a quieter operation: if specified, the GRAMIX parts may be coined and work hardened, even prepared for plating.

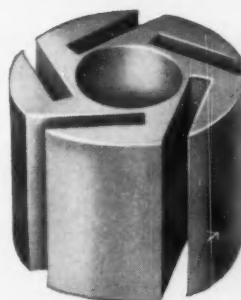

The rotor is only one of thousands of applications in which GRAMIX precision parts have proved to be ideal. Just a few of them are shown here, so consider the components of your products . . . there may be several that could be improved . . . with GRAMIX! Products of powder metallurgy you can rely on.

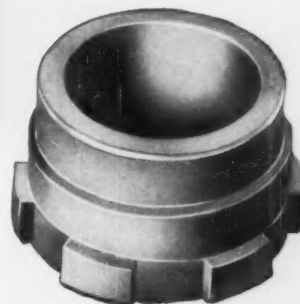

Hardened steel drive sprocket for lawnmower

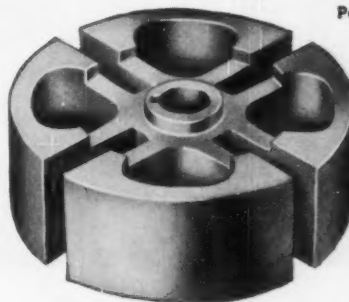

Iron switch control

Rotor for gasoline pump

Packing gland follower used in hydraulic system

Bronze rotor in high speed fueling unit

J-M Die-formed Packing Rings for all process fluids

Whether you are designing a bathroom fixture or a high-pressure valve, you can now choose your packing rings with greater certainty of both maximum sealability and easy assembly. For Johns-Manville has grouped its die-formed packing rings into three tolerance ranges—*dense*, *soft* and *metallic*—to fit your equipment needs.

Johns-Manville Die-Formed Packing Rings are precision-made for many fluid services including oils, tars, corrosives, solvents, fresh and salt water, steam to 1200 F, pressures to 4000 psi (on special valves to 60,000 psi). Special J-M rings with controlled friction are made for high-grade plumbing fixtures.

Check the tolerance chart below

Lasting corrosion protection for valve stems in storage. Ordinary corrosion inhibitors fail to protect after the sacrificial metal is consumed. J-M No. 9 operates on an entirely different principle. Photograph shows how under accelerated tests, the sacrificial inhibitor (at left) failed after a few weeks but the valve stem protected by J-M No. 9 (at right) was clean months later. Specify J-M No. 9 inhibitor when you order J-M die-formed packing rings.

... your Johns-Manville Packing Representative will be glad to give you lists and descriptions of the styles in each range and those with which the J-M No. 9 Corrosion Inhibitor (see right above) may be specified or is standard. Write Johns-Manville, Box 14, New York 16, N. Y. In Canada, Port Credit, Ontario.

Three more nationally known manufacturers select Mueller Brass Co. Forgeable Bearing Alloys for vital components of their products

In ever-increasing numbers, Mueller Brass Co. specialized alloys are being specified by manufacturers of top-quality products. In a series of continuing advertisements, we have presented case histories of successful applications, to which we now add three more distinguished companies who are incorporating Mueller Brass Co. forgeable bearing alloys in their products to meet the demands of widely divergent operating conditions.

U. S. INSTRUMENT CORPORATION

U. S. Instrument Corporation, Charlottesville, Va., selected abrasive-resistant Mueller bronze alloy bushings for their remarkable telephone selector switches after exhaustive tests of many materials. A vital communications link on today's U. S. Naval vessels, these sound-powered telephone circuits must meet rigid Navy performance-standards. Such phones, for example, must have selector switches which are capable of rotating for a minimum of 50,000 torturous cycles . . . 360° clockwise, followed by 360° counter-clockwise. In addition, the "O" ring must still form a water-tight seal AT THE END OF THE TEST! Of the many tested, a Mueller Brass Co. special manganese bronze alloy was the best one meeting these rigid specifications.

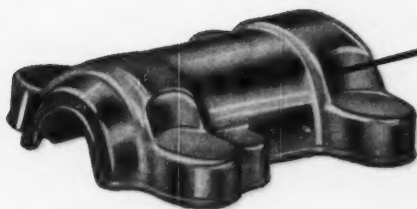

There were other important reasons why these bushings were chosen by U. S. Instrument Corporation for this

application. Resistance to abrasive action against the rubber "O" ring was a prime one . . . then, too, the stem assembly suffered severe pounding through the action of the indexing mechanism which, prior to the use of the Mueller Brass Co. alloy, caused repeated seizure of the component parts. In this particular application, the part was fabricated on an automatic screw machine rather than produced as a forging. The versatility of Mueller Brass Co. alloys makes them readily adaptable to the most economical method of fabrication dependent upon the size, shape, and end-use requirements of the part.

In commenting on the success of this part, U. S. Instrument Corporation praised the alloy for its tensile strength (ordinary brasses could not withstand the 2000 ft. lb. impacts without deformation), for its machinability and corrosion-resistance.

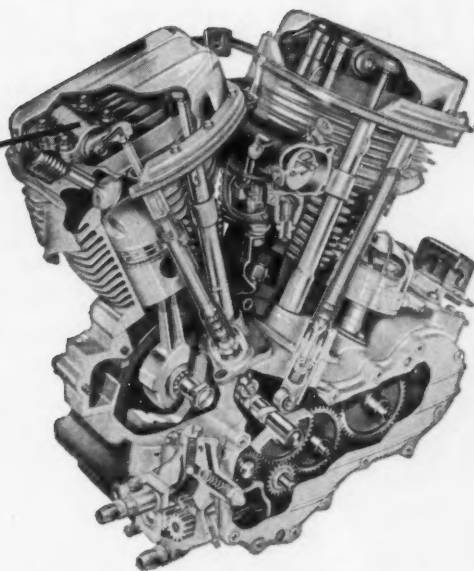

MUELLER BRASS CO.

HARLEY-DAVIDSON MOTOR CO.

Harley-Davidson motorcycles (made in Milwaukee, Wisconsin) have, since 1903, enjoyed a world famous reputation for economical, reliable transportation. These versatile machines are ideally suited for pleasure, for commercial or business use, as well as the grueling demands of law enforcement work. Harley-Davidsons boast a dependable engine . . . one which can roll up an astounding mileage record with little or no care. The painstaking selection of every engine component is one important reason for this reliability. The new twin-cylinder Harley-Davidson 74 OHV

employs Mueller Brass Co. bronze alloy forgings in the form of rocker-arm bearing caps. Subjected to violent temperature changes, fast starts and stops and road shock, Mueller forgings are proving again and again that they have the ability necessary to withstand almost any punishment . . . and still provide unflinching service.

JACOBSEN MFG. CO.

Jacobsen Mfg. Co., Racine, Wisconsin, was among the first to produce a practical power mower for home use. That was more than 35 years ago! Today, Jacobsen power-mower dependability is evident itself in more than a dozen gleaming new models such as the popular Pacer, Lawn Queen, Manor and others. One of the most reliable components in the always dependable Jacobsen hi-torque engine is a Mueller Brass Co. connecting rod forged from special bronze alloy. Jacobsen mowers with Mueller-forged connecting rods are called upon by some commercial users to operate as much as 8 hours daily, 6 days a week . . . perhaps as much as 2000 hours a year. In searing summer temperatures, thru hours of constant operation, the high uniform strength of Mueller bronze forgings constantly withstands pounding and vibration with the same conspicuous success as in its many other applications.

Why not investigate these specialized alloys for your own products. We welcome your inquiries. Our engineering staff will be happy to make specific recommendations. Both on the proper alloy and the best method of fabrication to meet your needs . . . exactly. Our engineering manuals show many, many examples of how American manufacturers have used these alloys to great advantage.

Drive Package Provides Infinitely Adjustable Speeds from AC Power Source

The complete Dynamatic power package includes all components required to provide infinitely adjustable speeds from an alternating current power source. A Dynamatic Ajusto-Spede® or Dynaspede® Drive, with electronic control and pushbutton station, satisfies the requirements of almost any application where proper machine operation or material processing depends upon control of operating speeds.

The compact control panel may be remotely mounted to conserve valuable space on the driven machine. The pushbutton station at the operator's position puts vital controls conveniently at the operator's fingertips and requires a minimum of space.

Speeds are infinitely adjustable from 0 RPM to full output speed, and accurate speed regulation may be obtained from 100 RPM to full output speed.

Ajusto-Spede® Drives, available in ratings of $\frac{1}{4}$ horsepower to 75 horsepower, are air-cooled. Dynaspede® Drives, rated from 3 to 75 horsepower, are liquid-cooled. Raise your productive efficiency with Dynamatic eddy-current units.

...for hot performance...**LONGER**

**LINEAR CONTROLS THE HEAT
IN JET ENGINE EXHAUST**
with Jet-Age "O" Rings

Jet engine exhaust controls are subject to severely high temperatures. The dependability of any seals in the exhaust area of a jet engine has to be commensurate with the dependability of the engine itself.

LINEAR'S ability and extensive experience in the design and manufacture of precision "O" rings—in such modern, heat-resistant elastomers as the silicone family—makes this kind of dependability a reality. LINEAR "O" rings, capable of withstanding intermittent ambient temperatures as high as 1000° F—and the destructive actions of gases and fluids, help control the jet engine exhaust—for hot performance—longer.

For a sealing problem of any kind—call on LINEAR or one of its agents for engineering assistance...

and be sure to Specify LINEAR "O" Rings for every application.

A great gear-motor

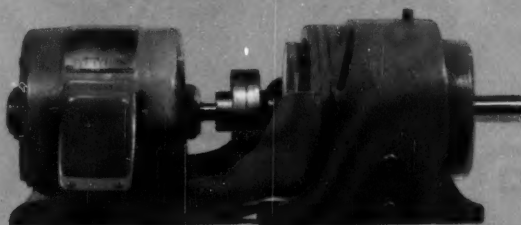

NEW integral unit

Compact, one-piece unit has complete, easily removable motor, machined-in alignment.

NEW all-motor unit

Providing wide application flexibility, motor change may be accomplished without disturbing gear.

evolution...

General Electric's

NEW

gear-motor line

Now, you can meet all your low-speed drive requirements from a brand new line of General Electric packaged power transmissions. This 3-unit line is based on a new, completely simplified, helical design that has evolved from General Electric's 25 years of gear-motor engineering and application experience. And it's a line that can provide you with important, 3-way savings on all low-speed applications.

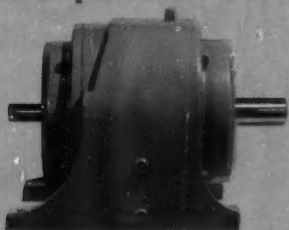

1. Greater reliability: This new line incorporates the most advanced gear manufacturing methods and all units are factory tested before shipment. In addition, you benefit because you purchase both motors and gears from a single manufacturer.

2. Easier Maintenance: A cinch to assemble and disassemble, alignment is machined right into each unit. Gear components may be carried in stock as sub-assemblies, minimizing downtime for normal repair.

3. Reduced inventory: You can reduce your inventory with no sacrifice to your operating continuity. Parts standardization and interchangeability permit a basically lower inventory investment.

This new line was developed to keep pace with the new requirements and wider applications of gear-motors brought about by advanced manufacturing techniques. *Get complete information from your nearest Apparatus Sales Office or Distributor—or write for bulletin GEA-6704, containing line highlights, to General Electric Co., section 851-6, Schenectady, N. GENERAL  ELECTRIC

See what adhesives are doing today!

A MODERN FASTENER SPEEDS THIS ASSEMBLY LINE. IT NEEDS NO HOLES, BONDS PARTS INSTANTLY. IT'S 3M ADHESIVE EC-1357.

Simplifying the assembly line

A 3M adhesive is helping to create 50 shelves per hour right before your eyes. By bonding parts instantly, EC-1357 simplifies this assembly line to just four fast operations.

One worker puts metal frames and fiberboard sheets on a conveyor moving 9 feet per minute. The second sprays EC-1357 on both as they pass by. The

third positions the boards on the frames. They pass under a pressure roller and the bond is complete. There are no extra fastening steps.

Instantly EC-1357 bonds board to frame so strongly that the fiberboard will delaminate if you try to remove it. A fourth man installs molding. The shelves are ready to ship immediately.

Hundreds of other 3M adhesives serve industry in a thousand varied uses.

SEE WHAT ADHESIVES CAN DO FOR YOU!

OILITE

**IN AN AUTOMATIC
WASHER HELPS BUILD
CUSTOMER SATISFACTION
-YET COSTS NO MORE**

Photos courtesy Whirlpool-Seeger
Corporation St. Joseph, Michigan

Another cost-saving application of Amplex Powder Metallurgy

Quality is a *must* for trouble free operation, continued customer satisfaction. And quality depends upon the excellence of every part, every component. For many years Whirlpool-Seeger has used OILITE center post bearings, agitator shaft bearings, water pump bearings and pulley bearings in their automatic washers. Whirlpool-Seeger uses these and other OILITE parts for very good reasons.

First of all, the manufacturer knows OILITE heavy-duty bronze bearings will meet specifications. Chrysler-Amplex precision production assures him OILITE bearings capable of carrying their loads safely, surely and quietly.

Then too, Chrysler-Amplex plant and facilities—

largest and most complete of any in the metal powder fabrication industry—promises on-time deliveries in any quantity.

Moreover, in using OILITE bearings the manufacturer selects a product his customers know and respect for superior engineering.

Finally, this manufacturer, like a great many others, finds OILITE bearings—despite all their advantages—cost no more.

Chrysler-Amplex representatives and dealers are located in principal cities in United States and Canada. Let the nearby representative help you. Find him in the yellow section of your telephone directory under—"Bearings—OILITE."

Here you see the complete expanded 20-model line of International power—heavy-duty engines and power units that continue to justify the judgment of men who have specified International for more than 50 years.

Choose any of the 13 carbureted industrial engines, from 16 to 257 hp, or seven diesels, from 60 to 265 intermittent load hp, with full confidence. You'll always get an engine that delivers a full measure of dependable, economical power. And every engine is backed by the finest parts and service support in the world.

For full details on engines of interest to you, call in THE MAN FROM INTERNATIONAL. You'll find him as helpful as the power he sells will be profitable to your customers. Through him you can get assistance

with all installation problems, including pilot model engines, and very special delivery service when you need it. Just call his headquarters in Melrose Park, Illinois—Fillmore 3-1800.

PLANNED

PRECISION

In a bearing, **PLANNED PRECISION** is the carefully evaluated incorporation of whatever precision features are necessary to provide for the functional requirements of the job—not more, not less. Precision refinements are costly, and should be selected with care to insure products that are both economically and functionally correct.

In the **NICE LINE**, Product Designers will find a complete range of ball bearings incorporating varying degrees of precision. **NICE** catalog standard bearings are available in precision, semi-precision and unground types. If a specially designed bearing is the correct answer to the application problem, **NICE** engineers are qualified and capable "Specialists in Specials".

Write for Catalog No. 190

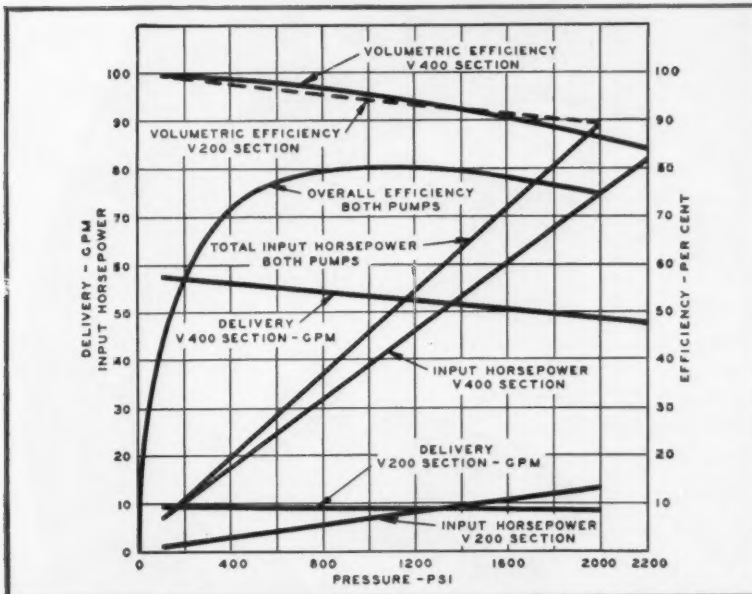

NICE is the word for **BEARINGS**

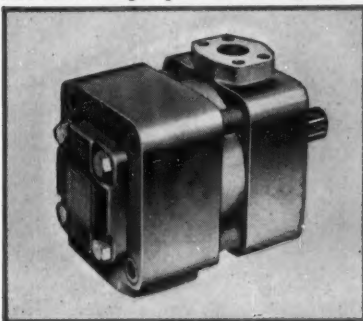

NICE BALL BEARING COMPANY

On tractor shovels, scrapers, lift trucks, truck cranes, bulldozers, motor graders, front end loaders, ditchers, trucks, buses and many other types of mobile equipment . . .

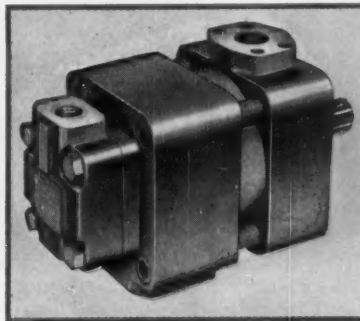

The High Efficiency of Vickers Balanced Vane Pumps Means More Work From Less Input Power

COMPARE the performance of this VICKERS Series V4200 double pump with any other hydraulic pump used on mobile equipment. The high overall efficiency in the operating pressure range is maintained throughout the long pump life (see right hand column for reasons). This performance is characteristic of all Vickers Vane Pumps . . . both single and double. (Above curves are in accordance with SAE test code except speed is 2000 rpm.)

Series V400 pump (single) is large section of double pump at right; performance characteristics are shown above. In addition to the advantages mentioned in the right hand column, Vickers Vane Pumps require minimum maintenance and are exceptionally compact. Their various mountings and optional pressure outlet connection positions provide greater application versatility. See pages 4-5, Bulletin M5101A.

Series V4200 double pump for operating two independent hydraulic circuits from one power source. In numerous mobile applications, this is desirable to eliminate all possible chance of one operation interfering with another . . . when necessary to operate two machine components simultaneously at different speeds and hydraulic pressures. See pages 6-7, Bulletin M5101A.

You can get more useful work out of a given engine when a Vickers Balanced Vane Pump is used in the hydraulic control system. Its exceptionally high volumetric and overall efficiency are available not only when the pump is new but also throughout its long life.

The performance curves at the left merit your careful consideration. Note that the overall efficiency is approximately 80% at operating pressures used. Compare this with the rapid decline in overall efficiency of the usual gear pump at higher pressures. This large difference means a very substantial saving in engine horsepower and fuel consumption. To do a given job, it often means that a smaller engine can be used. It further means less heating of the oil.

Vickers Balanced Vane Pumps have many other benefits for the user. Optimum running clearances are automatically maintained over the entire operating pressure range and throughout an exceptionally long pump life. Complete hydraulic balance eliminates pressure-induced bearing loads. Other bonuses are: automatic wear compensation, temperature adaptability, simple installation, and easier cold weather starting.

Millions of Vickers Vane Pumps are in daily use. For further information, write for Bulletin M5101A.

Dimensional Stability plus

HEAT RESISTANCE

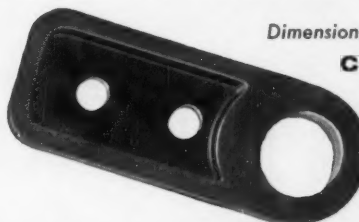

These, combined with fine electrical properties, make Durez phenolics preferred for countless applications. Illustrated: mounting base for King-Seeley's new Chef-O-Matic range surface element temperature control.

Dimensional Stability plus

DURABLE SURFACE LUSTER

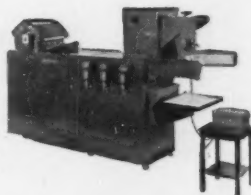

Smooth operation of the lens tube on the Wollensak Automatic Slide Projector is assured by molded-in threads that meet exacting tolerances. It's engineered for attractive appearance in lustrous black Durez phenolic.

Dimensional Stability plus

CHEMICAL RESISTANCE

Print conveyor bearings molded of nylon-flock-filled Durez phenolic operate submerged in Photostat Photographic Processors, withstand the effects of processing solutions and the wear of rotating metal shafts.

DUREZ PLASTICS

It's obvious that you just can't stop with one outstanding property—or even two or three—when you're looking for a plastic to solve a design problem... improve a product...hold the cost line. This is why the Durez thermosetting plastics are a gold mine of ideas for design engineers.

Durez offers balanced properties in a great variety of useful combinations.

For close-tolerance components resistant to impact, heat, water and chemicals...and wherever good electrical characteristics are essential... count on success with Durez phenolics. Their batch-to-batch uniformity and excellent molding behavior permit design in intricate shapes and hold down cost. Many are formulated for easy preforming and molding in automatic machines.

Where very high volume resistivity and arc resistance are required, investigate the Durez diallylphthalate materials.

For data and information keep in touch with your molders...call on our field engineering service...or let us send you our monthly "Plastics News."

BEST for designing into new air systems . . .
BEST to specify for blower replacements . . .

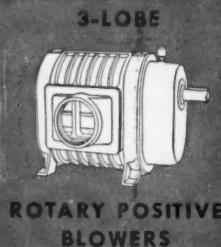

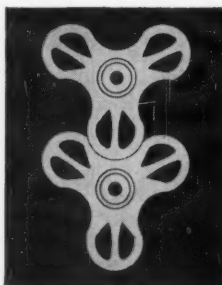

THERE'S A BIG DIFFERENCE WITH Miehle-Dexter 3-Lobe Rotary Positive Blowers

- ① **Smallest Cube OF ALL ROTARY POSITIVE BLOWERS**
- ② **Lightest Weight WITH ALUMINUM ROTORS AND HOUSING**
- ③ **Wide Pressure Range 1 TO 12 PSIG**
- ④ **Wide Speed Range 1000 TO 4000 RPM**
- ⑤ **Exclusive Formica Wear Strips ON ROTORS
Patented Rubber Grid Seal ON END PLATE**

When specifying components for new air systems, or for replacements in existing systems, size and weight considerations are important if maximal space utilization is to be realized. When it comes to size and weight considerations for blowers, none compare with Miehle-Dexter 3-Lobe Rotary Positive Blowers. The advantages of wide pressure and speed ranges, with capacities from 50 to 4000 cfm, make M-D blowers the most efficient for moving materials by air. There's a big difference when M-D blowers are used. May we demonstrate why?

The performance figures are convincing . . . write today!

**Important advantages
in pressure range,
size, weight,
cost, service!**

A special V-Belt Engineering Service to help you cope with 7 Drive Problems created by space-saving modern design

A checklist of V-belt drive designs which require specialized engineering. With a description of the compensating characteristics which can be built into special Dayton V-Belts. Sources: Case histories from the files of the Dayton Special V-Belt Engineering Service and "The Dayton Handbook of V-Belt Drive Design and Selection."

Here's a typical example of efficient, compact, modern design—an automatic washer with a Dayton V-Belt Drive.

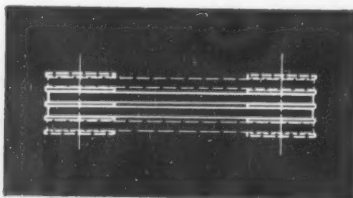

Note that it imposes three design requirements, (1) a tortuous back bend (2) sub-diameter pulleys (3) a limited tension take-up area. Yet the design is efficient because Dayton V-Belt engineers developed a belt especially adapted to these three punishing conditions.

You'll find similar examples in machine tools, agricultural machinery and

wherever drive space is limited. You've seen them yourself—the designs which dictate sheave misalignment, back-side idlers, underbelting; plus others which use V-Belts as a clutch and which impose excessive shock loads on the belt.

HERE ARE THE MAJOR CONDITIONS WHICH AFFECT V-BELT PERFORMANCE

Underbelting

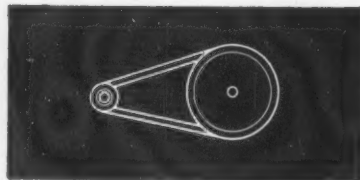

Underbelting is found where space is limited or as a result of very low belt speeds. It will cause belts to slip, run hot and wear out very quickly. A temporary cure, commonly employed, is to over-tension the belt—thus throwing excessive loads on the bearings.

The design requires a high capacity belt with extra-strength cords found in Dayton's Super-Thorobred series or, in difficult cases, belts with both a high coefficient of friction and extra strength like the raw-edge Dayton Cog-Belt.*

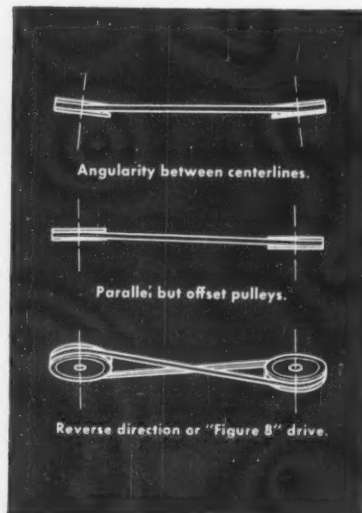

Sub-diameter sheaves

Belts driven by sub-diameter sheaves are inclined to succumb to accelerated flex failure. Tensioning problems are a usual result.

Sub-diameter sheaves require extremely flexible belts for satisfactory service. The required flexibility may be obtained by using thin V-Belts—where drive capacity is not high. When considerable capacity is required, Dayton Cog-Belts will give the most satisfactory performance. Their exclusive design permits exceptional flexibility. Die-cut raw edges provide high coefficient of friction, transmit maximum power from sub-diameter sheave arcs.

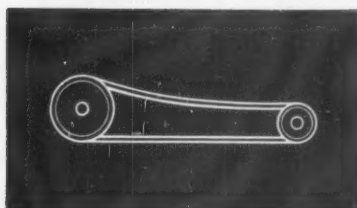

Misalignment

Misalignment causes uneven tension across the face of the belt—producing abnormal belt and pulley wear and uneven bearing loads.

A suitable approach is to use highly extensible cords of the latest synthetic fibers in the strength band of the V-belt. Dayton's Development Engineer can prescribe the material best suited to your needs.

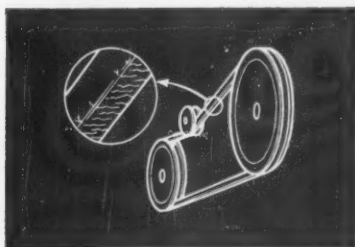

Fixed centers

Proper tension cannot be maintained with fixed centers or where center distance adjustment is inadequate. Without proper tension, belts slip and need frequent replacement.

Dayton V-Belts with low-stretch neutral-axis cords are best suited for applications with little or no provision for center distance adjustment. Still higher performance is gained if the belts have maximum cross-sectional stability which helps keep the belt from seating in the sheave groove.

Back-side idlers

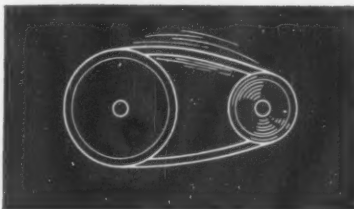

Cracks will appear on the under side of the belt, since back-side idlers force the belt to flex in a direction contrary to its construction. Use of spring-loaded back-side idlers may result in belt-snapping.

Where back-side idlers are used to provide tension take-up, they must never be smaller than the smallest pulley in the drive. Dayton V-Belts used in this case employ tension or stretchy

type materials in the compression section and have a relocated neutral axis.

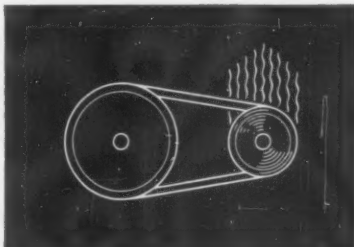

Excessive shock

Excessive shock can cause the belt to snap as well as promote bearing troubles and sheave misalignment.

Belts subject to excessive shock or heavy pulsation require strength band constructions which offer changeable ratios between stress and strain without taking a permanent stretch. Belts with soft cross sections—that will ride up and down in the groove—work well under shock as do wide angle belts. Any of these belts are available from Dayton.

Using as a clutch

V-Belts are ordinarily designed for constant loads and will burn when used as a clutch.

But, belts especially designed for use as a clutch will readily slip when a load

is suddenly applied or released. Dayton cover stocks used here have a low coefficient of friction and high resistance to wear.

DAYTON'S SPECIAL V-BELT ENGINEERING SERVICE

Make use of Dayton's Special V-Belt Engineering Service when you encounter any of these designs. Your Dayton V-Belt design engineer is an expert who has devoted himself exclusively to V-Belt Drives. Your design may permit a minor modification which would adapt it to the use of low-cost standard V-Belts. Other standard Dayton V-Belts available for special applications are the Double-Angle V-Belt, the Double Cog-Belt, the Variable Speed Cog-Belt and the back-side idler V-Belt.

With one of the finest research and development laboratories in the industry, Dayton research engineers constantly advance V-Belt knowledge. They develop basic theory, prove the characteristics of the newest compositions and materials available to the rubber industry and test the performance of theoretical constructions. All of this acquired information is at your call when you need a special V-Belt.

Now, while your design is on the drawing board, is the time to call your Dayton V-Belt design engineer. He'll help you select the V-Belt which is tailored to your specific drive. The result—a compact, versatile design which meets all your minimum design requirements and one that will give its users years of trouble-free service.

Industrial Sales Engineers in Atlanta, Chicago, Cleveland, Dallas, Dayton, Minneapolis, Moline, New York, San Francisco and St. Louis.

tough fabricating job on fire engine proves 4-WAY'S® versatility

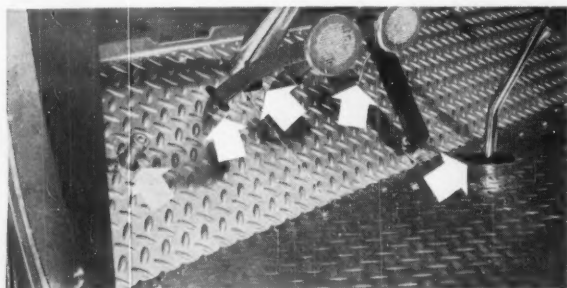

Fabrication to form even the varied and complex shapes used on firefighting equipment is no problem with 4-WAY Safety Plate. No special tooling is necessary. Ordinary cutting, drilling, forming and similar standard shop equipment is all that's needed. Good reason why this leading chassis and body manufacturer has specified Inland 4-WAY for more than 15 years! 4-WAY is used in an uncommonly wide variety of ordinary and extraordinary applications. For complete information and specifications, write Dick Prendergast, Room 1262 at the address below.

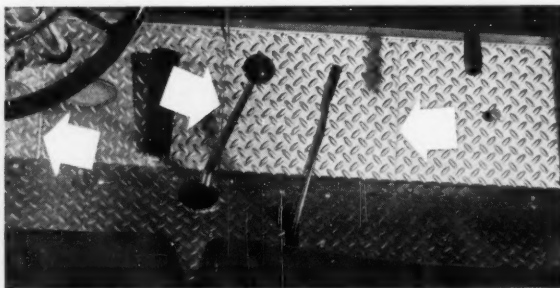

Uniformity of 4-WAY's cross-sectional thickness eliminates the possibility of deflection while bending, even at sharpest angles. Standard equipment can be used.

Whether the application calls for welding, bolting, or screw fastening, all are easily accomplished on 4-WAY with conventional methods.

Punching, drilling or flame cutting holes for fasteners, foot pedals, etc. is no problem with 4-WAY.

Notice how cleanly the plates for this floorboard are joined. 4-WAY can be sheared to extremely close tolerances eliminating all guesswork and make-overs.

CUSTOM-DESIGNED AND MASS PRODUCED TO YOUR PARTICULAR REQUIREMENTS

Dot plug buttons were originally used in automobiles to fill spaces on standard models which, on de luxe models would be occupied by such extras as cigarette lighters, radio controls and so on. They are now also widely used as lenses for indicator lights and as identification buttons on instrument and control panels of all kinds.

Available in clear or colored plastics...brass or steel in all standard finishes...embossed and enamel-filled or molded to show company insignia or other identification symbols... Dot plug buttons snap into place and stay where they're put even under conditions of extreme vibration. Yet they can be removed and replaced repeatedly without damage.

Always, at **SKF**, you will receive
unbiased advice

because

— All four basic types of anti-friction bearings are available from **SKF**.

because

— They offer an extraordinarily wide range of sizes and combinations to meet virtually any requirement.

because

— Their long experience in the widest variety of bearing applications is your assurance of receiving sound recommendations.

because

— Thousands of manufacturers have been using the **SKF** Bearing Advisory Service for many years — always with good results. This dependable service is available to you, too. 7754

News about

B.F. Goodrich Chemical *raw materials*

Approximately 70 different Hycar rubber parts are used in cash registers and accounting machines manufactured by The National Cash Register Company, Dayton, Ohio. B.F. Goodrich Chemical Company supplies the Hycar rubber material. Some of these parts are: Impression Rubber in the Printing Mechanisms • Feed Rolls for Paper and Card Stocks • Tension Rolls and Plates • Stops and Stop Blocks • Vibration Dampeners • Cabinet Insulating Rubber • Solenoid Mountings • Spacers • Bumpers • Arresting Rolls • Support Brackets • Grommets • Bushings • Pulley Facings • Braces • Slip Feelers

OIL RESISTANT HYCAR RUBBER CUTS BUSINESS MACHINE MAINTENANCE

TO absorb shock, support weight, deaden sound, supply driving power, dampen vibration... these are some of the jobs being done in business machines by parts of Hycar nitrile rubber.

Hycar rubber is ideal for these parts because most of them have to resist oil which destroys ordinary rubbers. Equally important is Hycar's resistance to the attack of solvents and other fluids used for

machine cleaning and maintenance.

Versatile Hycar has many other unique properties for applications requiring: flexibility with high strength; superior aging; exceptional resistance to abrasion, oxidation, pressures, gas, temperature extremes and many chemicals.

Hycar nitrile rubber has made possible the development of many new products and the improvement of existing products. For informa-

tion, write Department HK-6, B.F. Goodrich Chemical Company, 3135 Euclid Avenue, Cleveland 15, Ohio. Cable address: Goodchemco. In Canada: Kitchener, Ontario.

WHY THINGS RUN SMOOTHER WHEN YOU SPECIFY HYATTS

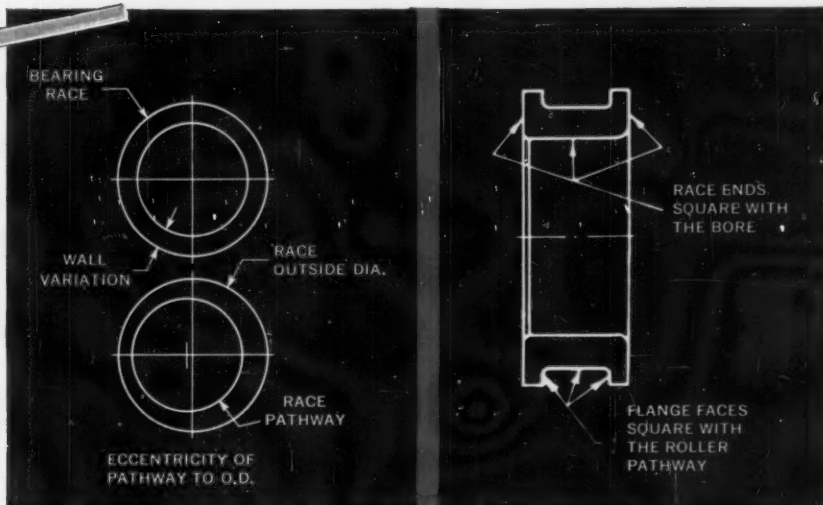

FIGURE 1

FIGURE 2

CLOSE CONTROL OF INTERNAL DIMENSIONS MEANS LONG, TROUBLE-FREE BEARING LIFE

The running accuracy and smoothness of a roller bearing is governed by the tolerances of its internal dimensions and clearance. Internal dimensions include concentricity of race diameters and squareness of all radial and axial surfaces, as briefly explained at right.

Because the internal dimensions of HYATT Hy-Roll bearings are so closely controlled, HYATTS run smoothly and quietly, last longer, and prevent equipment trouble due to excessive heat and vibration. You will find full selection and application data in HYATT Catalog 150, or call your nearest HYATT Sales Engineer. Hyatt Bearings Division, General Motors Corporation, Harrison, N. J.; Pittsburgh; Detroit; Chicago; and Oakland, California.

Concentricity of race diameters is usually defined in terms of wall variation (Figure 1) of the individual races, and radial run-out of the assembled bearing. Squareness of race and roller ends and flange faces is vital to prevent roller skewing with consequent heating and noisy operation. Figure 2 indicates the race surfaces which must be square with each other within minute tolerances depending on the grade of the bearing. The roller ends must also be square with the diameter for the same reason as above. End square tolerances are usually less than .001" for the most frequently used sizes.

overall length 42 inches

Now...from Doehler-Jarvis...die castings

X-ray of the Falcon's fin proves

The Falcon is an air-to-air missile built by Hughes Aircraft Company for the U. S. Air Force. Its light weight die cast stabilizer fins resist severe strain during course changes. It uses other Doehler-Jarvis die castings also.

Now *you* can have structurals die cast to standards as high as those for primary aircraft structurals*.

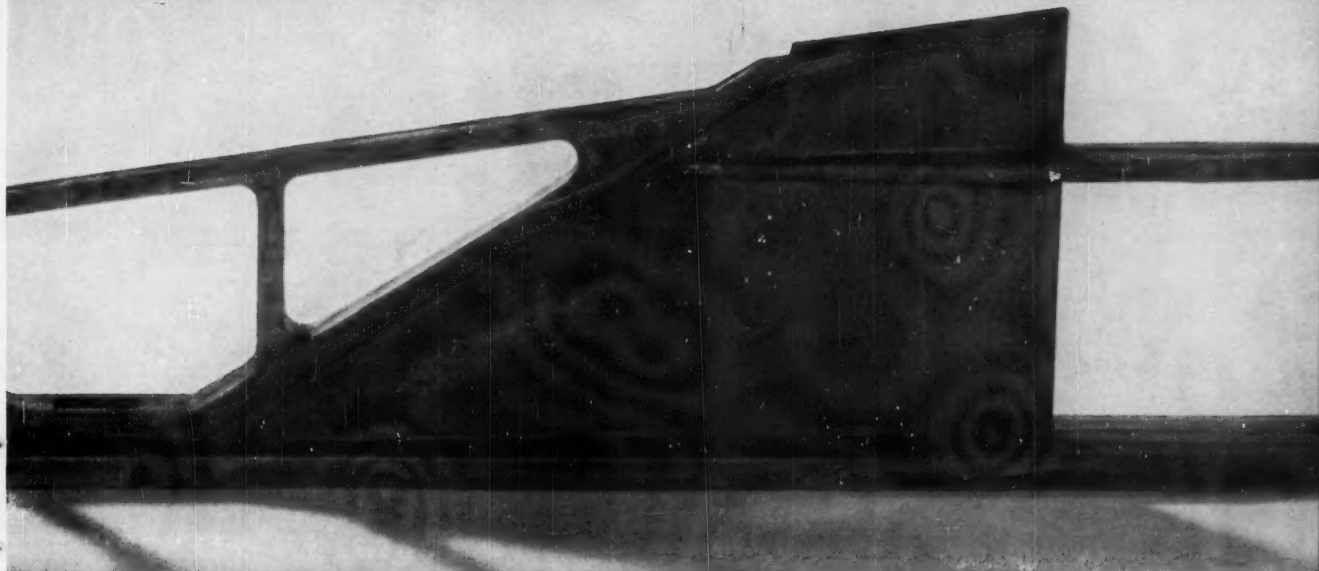

Die cast! With all the economy, precision, surface superiority, ease of assembly that implies. Die cast of aluminum, or of a high-purity magnesium alloy, like the 42" Falcon stabilizer fin.

They said it couldn't be done!

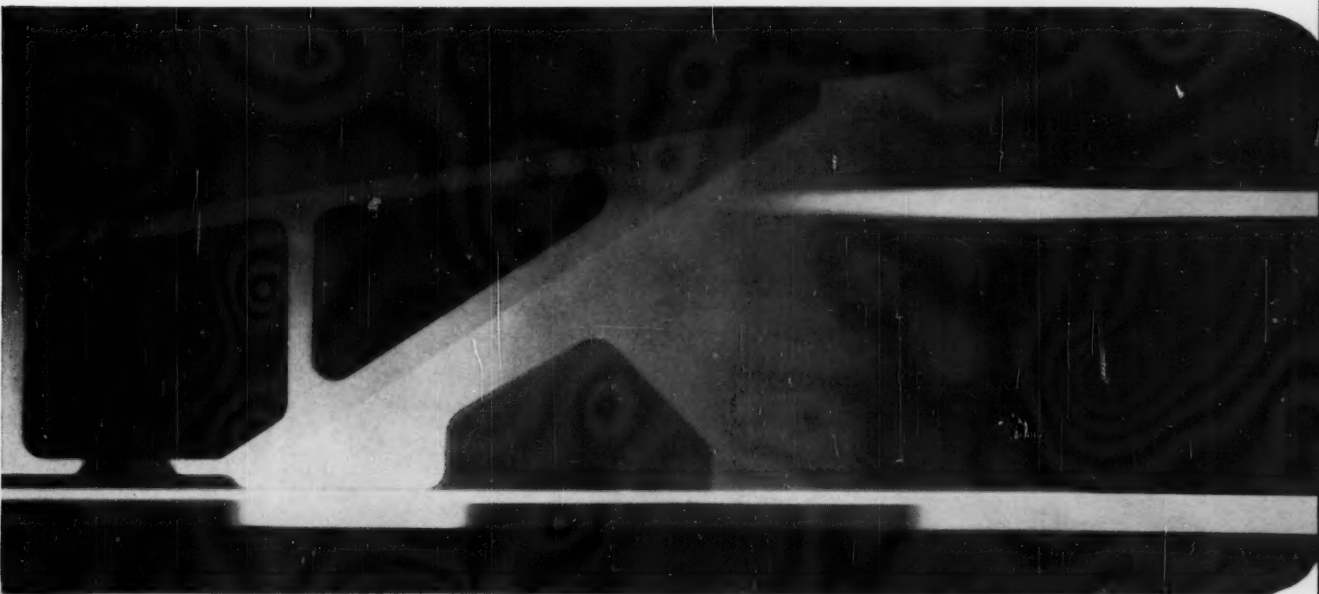

But there you see such a structural! Along with X-ray proof of soundness, uniformity, primary-aircraft-structural* quality.

Mind you! The Falcon fin is in commercial production. Doehler-Jarvis has die cast thousands. Each has had to pass 73 inspections before acceptance...including 100% X-ray.

In *one* control, sections of castings are continuously tested for tensile strength. In this examination of physical properties, the castings normally exceed tensile specifications by 15% or

of primary-aircraft-structural* quality

their uniformity and soundness

more. Quality is so high there has never been a single test below specification.

How did this come about?

Like many developments in die casting, this one started with a customer's need... Hughes Aircraft's.

They, and the Armed Services, needed such castings. The parts *might* be made other ways. But at what cost! What sacrifice in weight — and materials! If it *could* be die cast, if there *were* a magnesium alloy able to stand supersonic air stresses...

It took a while. But, with close cooperation from engineers of both Doehler-Jarvis and Hughes, the way was found.

Now you can list die castings of primary-aircraft-structural* quality among D and J availabilities. Get them from any Doehler-Jarvis plant,

*A primary aircraft structural is a major load-bearing component member any single failure of which would result in loss of the aircraft.

NEW!

LOOK AT THE 14 POINTS WHERE ALLIS-CHALMERS D-14 TRACTOR RELIES ON NATIONAL SEALS

At 5 positions in the new D-14, Allis-Chalmers specifies steel-encased, spring-tensioned National leather oil seals. Two additional positions employ steel-encased, spring-tensioned Syntech[®] synthetic rubber seals. At still another position, the control shaft torque tube, a springless rubber-covered National Syntech is used.

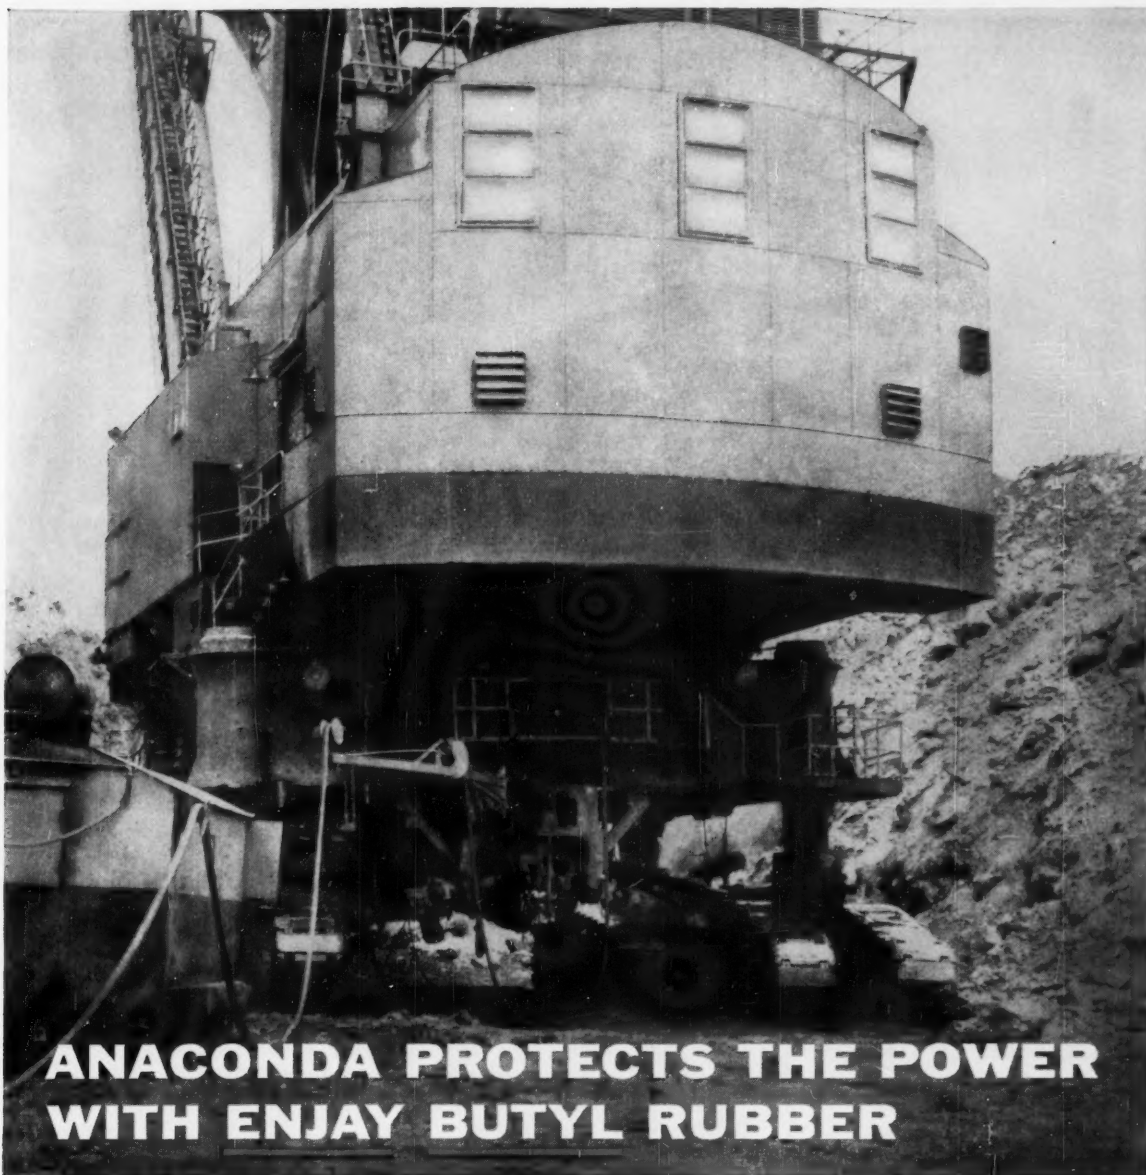

All National seals in the D-14 (and many in Allis-Chalmers' equally new D-17 tractor) are standard design National seals. National supplies over 2,500 different types and sizes of oil seals, leather or synthetic. New seals are being designed daily to meet special applications.

For factual, professional engineering help on any shaft sealing problem, call your National Applications Engineer. He's listed in the Yellow Pages, under "Oil Seals—National Seal Division." He's backed up by 36 years of sealing experience, and the productive capacity of three modern plants.

ANACONDA PROTECTS THE POWER WITH ENJAY BUTYL RUBBER

Talk about impact resistance! The 5-year-old Anaconda cable supplying this giant shovel with power was buried under thousands of tons of rock when a whole wall of the open pit mine caved in . . . yet the cable continued to supply power! This is one of the many Anaconda products featuring Enjay Butyl for outstanding performance.

Enjay Butyl is *unmatched* in its resistance to impact and abrasion, moisture and weathering, ozone and corona . . . properties that make it the world's outstanding rubber value.

Low in cost and immediately available in a grade tailor-made for *your* electrical application, Enjay Butyl is the rubber to boost performance and cut costs. For further information, and for expert technical assistance, contact the Enjay Company.

Because of intricate coring—together with internal bosses—sand casting seemed to be the only way to make this part. Necessary finish machining, however, boosted costs too high.

Then Parker die casting engineers tackled the job—and licked the coring problem. The result: a part with greater density, closer tolerances, better surface finish, no finish machining and—best of all—*much lower cost per unit*.

Here is just another example of the way Parker-engineered die castings save you money.

Parker has been a leader in die casting for over 50 years—an old hand with new ideas. This skill and experience can solve problems—and save money—on *your* component parts. Just call the nearest Parker sales engineer or send your prints to the factory direct.

HOW CAN YOU USE THIS NEW TYPE OF

ArmaSteel®

Tensile strength, 105,000 • Minimum yield, 85,000 • Minimum elongation in 2", 2% • Brinell hardness 269-302, (3.5-3.7 mm) Machinability 20% better than steel of same hardness!

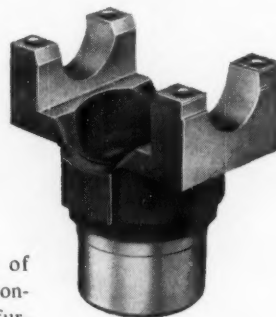

ARMASTEEL 88M has been developed to fill the automotive industry's needs for a material having increased wear resistance and high yield strength, yet at the same time retaining good machine characteristics.

ARMASTEEL 88M does not require heat treating and thus relieves customer facilities or eliminates capital expenditures. In many parts, distortion is a problem after heat treating. Parts made from ArmaSteel 88M can be machined without further heat treatment and still give good wear resistance.

This new castable metal is a pearlitic malleable iron which possesses substantially the same strength and the same wear characteristics as alloy steel forgings. Being a castable material, it has the two advantages of design flexibility and good machinability. Why 88M possesses these characteristics—and how it will fill the needs of American industry will be of interest to manufacturers and engineers in many fields . . .

PRODUCTION OF 88M—By accurately controlling

Universal Joint Yoke

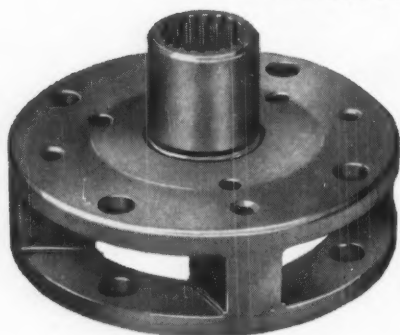

the heat-treatment of ArmaSteel 88M in controlled atmosphere furnaces at 1750° for approximately 15 hours, all massive carbides are removed. This heat treatment is followed by a rapid air quench from high velocity fans. Tempering is controlled to provide a narrow range of hardness.

Surface hardening of ArmaSteel, if desired, does not require carburizing. Instead, flame-hardening, induction-hardening or simple immersion methods may be used. A surface hardness of 50 Rockwell C to 60 Rockwell C can be readily obtained. Wear-resistant properties in the hardened area are comparable and sometimes better than carburized steel, while the remaining sections retain their original toughness.

MACHINABILITY—In addition to performance characteristics, ArmaSteel offers good machinability. Carbon spots that are present in the Matrix of ArmaSteel allow the chips to break off readily, effectively reducing machining time and prolonging tool life. In comparative tests, ArmaSteel shows itself to be a more freely-machining material than steel bar stock or forgings of the same Brinell hardness.

Because of its ability to assume the shape of practically any molded cavity, 88M not only permits great

Automatic Transmission Planet Gear Carrier

PEARLITIC MALLEABLE IRON?

88 M *developed by*

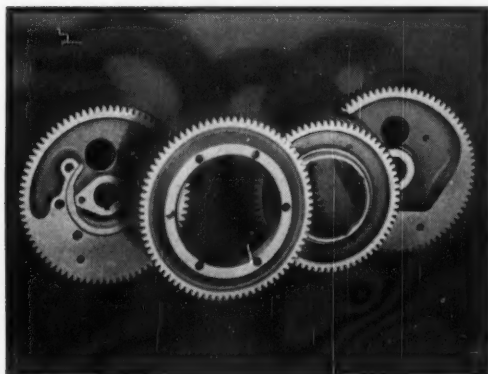

CENTRAL FOUNDRY DIVISION

freedom in design but also possesses certain inherent physical characteristics not present in forgeable alloys.

APPLICATIONS—ArmaSteel 88M is now being cast for automatic transmission planet gear carriers and universal joint yokes for leading automobile manufacturers. Other interesting applications now in the testing stage include transmission output shafts, and diesel engine idler, balance and crankshaft gears.

Just what hundreds of other applications are in store for 88M is still anyone's guess. But the more one examines its characteristics, the more it would seem that it will fill many needs in many types of products and industries. In your products, for example, you

Diesel Engine Idler, Balance and Crankshaft Gears

Transmission Output Shaft

may well see where 88M could both improve performance of components subject to great wear or great stress, and at the same time reduce final cost because of the economy in casting and the economy in a material with superior machining characteristics.

CASTING—Parts are cast in ArmaSteel 88M, here at Central Foundry Division, in either standard greensand molds or the newer, more precise shell-molds. In addition to 88M, Central Foundry Division produces castings, on a volume basis, in grey iron, alloy grey iron, malleable iron, and ARMASTEEL 84M, 85M and 86M.

Our research facilities and engineering staff are prepared to help you determine whether 88M or any of the other materials now being cast at Central Foundry will fill your needs or help you reduce your over-all product cost.

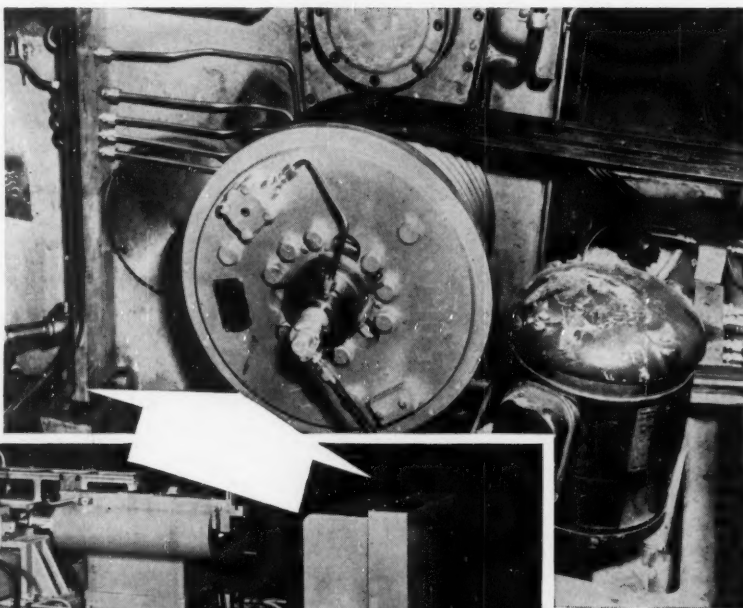

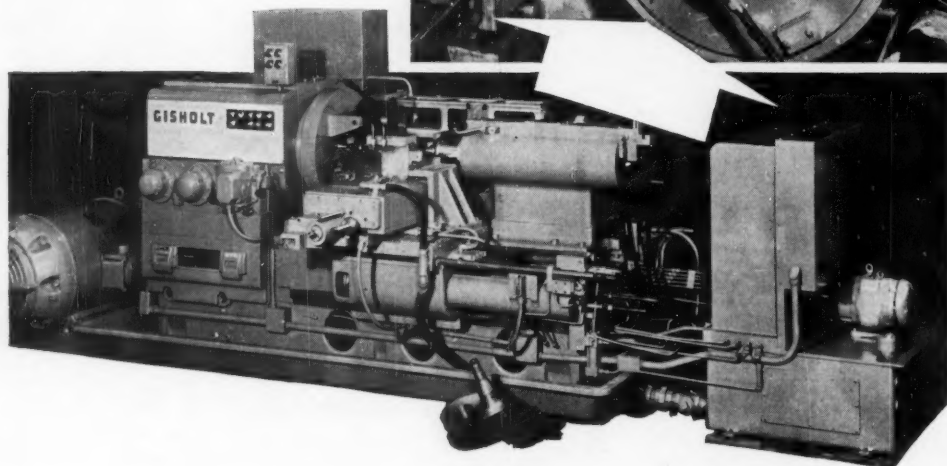

Write for your copies of our two comprehensive manuals, "ARMASTEEL" and "SHELL CASTINGS."

**For
convenient,
dependable
clutch
operation...**

...the swing is to AIR!

A good example of how air-operated clutches are used in modern heavy-duty machinery may be found in the current MASTERLINE No. 24 Automatic Production Lathe made by Gisholt Machine Company, well-known machine tool manufacturer located at Madison, Wisconsin.

The No. 24 Automatic Lathe incorporates a Twin Disc PO-114 Air Clutch for disconnecting the primary V-belt drive.

The rugged, heavy-duty construction of the PO Air Clutch—plus its high torque capacity—prompted this choice for the heavy-duty automatic lathe . . . but there are other reasons, too. Twin Disc PO Air Clutches offer:

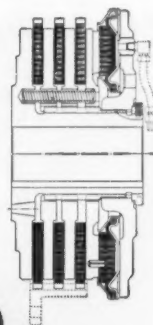

- A complete range of sizes . . . from 8" to 36" . . . to 127,100 lb.-ft. in torque capacity.

- Triple-plate, double-plate, and single-plate designs . . . to meet the widest variety of requirements.
- Clutch mass properly distributed in relation to friction area . . . for long life on high energy loads.
- Compact and rugged construction . . . with unusually narrow width for replacement of old-style clutches without extensive redesigning.

Latest models in the long-established, job-proved Twin Disc PO Air Clutch line are the new 8", 10" and 11 $\frac{3}{8}$ " sizes. These incorporate an exclusive cartridge-type diaphragm of long-lasting reinforced neoprene which eliminates leakage. They provide con-

stant torque capacity without adjustment . . . and are self-compensating for wear.

Like all Twin Disc PO Air Clutches, these new sizes prove excellent wherever the convenience of remote control is desired or necessary.

In the Highest Spirit

ANYONE for a trip to the moon? Five years, or perhaps even five months, ago the general public might have labeled such a question as the mark of a crackpot or comedian. But today—well, two sentinels circling endlessly overhead bear mute witness to the reality of man's achievement.

The successful launchings of Soviet satellites have met with mixed feelings all over the world. There is no denying that we have lost prestige in the race for space and will have to redouble efforts if we are to catch up—and go ahead. But whether we like to admit it or not, one fact stands out: The Sputniks are magnificent engineering achievements.

Few events in our history have so completely captured the public interest as the arrival of these planetary travelers. However, underlying that interest has been an uneasiness; a fear of the unknown, of what man has bitten off for himself, of the possible military advantage gained by a potential aggressor.

No one can calculate the total effect all of this has had on John Q. Public. But of one thing we can be sure. Any plan to catch up in this crucial race for technical superiority will require his wholehearted support. This endorsement will not be blindly given. He's going to be asking a lot of questions about a lot of things—and he's going to want, and expect, truthful, realistic answers.

For engineers, the opportunity is one of first magnitude. The basic facts of space flight are relatively simple and have been known for some time. By giving their ear and attention to the public as informed "consultants," engineers can help to dispel some of the fears, doubts, and tensions of those around them. By word as well as by deed, they will not only be making a valuable contribution to national security but will be taking a giant stride forward in the direction of the status they seek. For it is such conduct—unselfish service to the public—that is in the highest spirit of the true professional.

How to Measure

Engineering Department Efficiency

... a fast, accurate method of making a time allocation study

USUAL objective of timing engineering activities is entirely different from that of timing production operations. Factory operations are usually of a repetitive and fairly simple nature. After proper time study, a "standard" time can be established during which one operational cycle can be performed. This standard time is then used to predict hourly output, manpower requirements, labor costs, etc.

Due to the complex, nonrepetitive nature of engineering activities, time study in the usual sense is useless and is replaced by a study of time allo-

cation. This is, basically, a study to determine the percentage of the engineering day spent on each of the various activities carried on—designing, planning, research, drafting, etc. The usual way to study such a complex operation is to keep a running check of the engineer's day, recording what he works on at each moment. The results of the study can then be used to predict manpower needs, measure departmental efficiency, indicate necessity of reassigning jobs, etc.

Such a continuous study, if performed by a second person capable of judging what is being

Fig. 1—Work sheet for making observations during trips through the engineering department

By RICHARD PAULSON

Consulting Engineer
La Jolla, Calif.

done, may easily cost more than it is worth. In addition, resentment toward the study is certain to be felt by the person being timed. With someone watching him constantly throughout the day, the engineer is likely to skip the time he normally devotes to personal items and spend his time in a highly productive, but personally unsatisfactory manner. Engineering executives who have made studies of their own day, by keeping an account of what they did during each hour, usually find that the day is highly productive due to the self-imposed monitoring, but is not a "normal" day by any means and is nearly useless for planning or measuring purposes.

Due to the cost, inaccuracies, and personnel problems associated with continuous time-allocation studies, a technique has been developed to accomplish the desired objective by a simple form of statistical sampling. This method is based on the theory that studies taken in quantities, recording what each man is doing at one particular time, will accurately indicate how a group of people are spending their entire working day. This is the true purpose of time-allocation studies—deter-

Definition of Terms

Time Study—A stop-watch study of a standardized, repetitive operation. Objective is to find number of operations that can be performed in one hour or day. Use is for finding labor cost, manpower requirements, production quantities from a given time, etc.

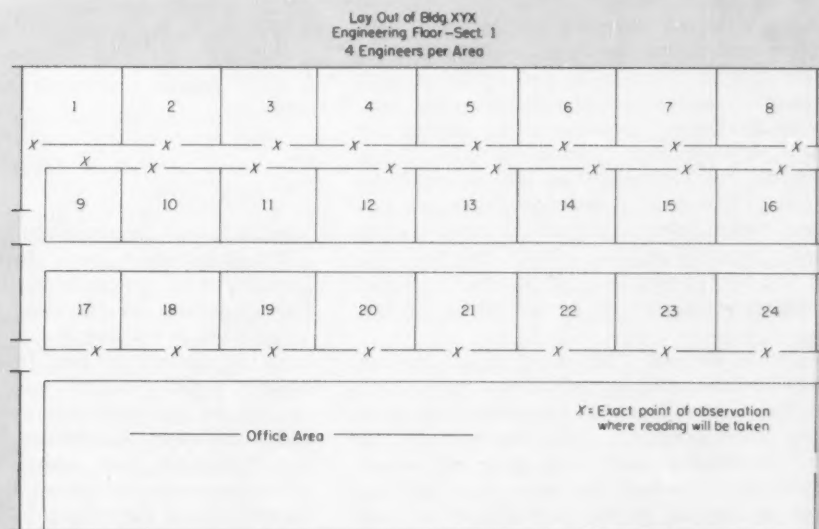

Time-Allocation Study—A timed, continuous study of nonrepetitive operations made by recording the time spent on each individual activity. Objective is to determine utilization of time, analyze a job, or to establish historical data for estimating time for future, similar jobs.

Ratio-Delay Time-Allocation Study—A nearly simultaneous observation of a random number of people (part of a larger group), recording what each is doing at the time. Objective is to determine overall or average utilization of time for each activity carried on by the group.

mination of departmental efficiency and pointing out specific activities that may contribute to low efficiency.

To measure efficiency or productivity, the job to be done must be defined. It must be decided which of the activities that are associated with an engineer's job should be done by him. Many

Fig. 2—Layout of engineering department, with stations numbered and observer's positions noted

activities that are associated with his job may or may not be justifiably considered productive engineering activities, depending upon whether or not individuals with less training and skill are capable of handling them.

What is productive engineering time? Thinking, studying, research, analyzing, reading, designing, drafting, checking, consultation, sharpening pencils, or plain day dreaming may all be considered productive. Only by determining the actual percentage of the engineering-department day that is utilized for each of the many activities going on, can any realistic appraisal of relative efficiency be made.

Preparing for the Study: A study of time allocation can be easily made on a departmental basis. A record of activities of individuals, picked on a random basis, will accurately indicate what is being done within the department. If such a study is made daily for a matter of a few weeks, very accurate results may be obtained and a study made of operations performed and percentage of total time spend on each individual operation.

Naturally, since engineers are both human and intelligent, there is likely to be a tendency to appear productive when the observer comes by. It is beyond ordinary reasonableness to expect that three men standing around a water cooler will not disperse when they see the observer coming. For this reason, the work areas are numbered and only about half are checked on each trip. The areas to be checked are selected on a random basis. Random checking of only a half also permits the check to be made much faster, reducing the tendency of the personnel to turn to other work.

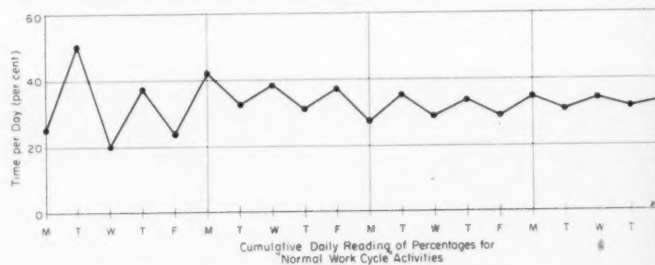

To a very large degree, the success of such a program is tied in with proper indoctrination of the personnel. The program should be explained in detail, how it will be handled, by whom, and most of all, why. It should be pointed out that the program is set up to measure overall departmental efficiency, with the objective of reducing non-productive and nonengineering time. As long as efficiency is to be increased by reallocation of work assignments, reassignment of nonengineering jobs, and simplification of procedures, engineering department personnel may be expected to co-operate and support the program. This will be especially true if it is known that the program is not part of a get tough policy; that time normally spent on purely personal matters will be curtailed little if any, and that in any case, all results are plotted on a departmental, not on an individual, basis.

The Study Method: The actual time allocation study is performed by a method known as Ratio Delay. This method has been associated with terms such as work sampling, ratio observations, the Monte Carlo method, random sampling, and others. The ratio delay method was introduced into this country in 1940 by Robert Lee Morrow of New York University and has since successfully demonstrated its usefulness in solving various problems

Fig. 3—Above—Summary count sheet for determining cumulative percentage values for each activity.

Fig. 4—Chart for plotting cumulative percentage readings of one specific activity. In this case, the "normal work cycle" activity readings are plotted.

accurately and inexpensively.

Although based upon statistical systems, the application of the study method is quite simple. The engineers are observed and the activity at which each is working is noted. At the end of the day, the number of men found engaged in each specific activity during each observation trip is totaled. As the study progresses, cumulative totals and cumulative percentages for each daily total are carried for each activity. After observations have been made for a number of days, an accurate time-allocation figure can be assigned to each of the activities performed by noting the final cumulative percentage value.

RESULTS OF ENGINEERING DEPARTMENT STUDY

A time-allocation study was made of the engineering department of the XYZ Mfg. Co. Purpose of the study was to determine the productivity of the department and to locate and measure any nonproductive activities.

The study was discontinued at the end of 20 days, since the curves had reached a point of stability and further observations were considered to be of little value.

Engineers were found to be devoting the time of each day to various activities as follows:

Designing	-----	14	%
Computing	-----	5	
Compiling information	-----	3	
Consultation (meetings)	-----	6	
Library research	-----	2	
Other (break-down attached)	-----	4	
Idle personal	-----	20	(this is much too high and should be thoroughly investigated)
Filing	-----	15	
Typing	-----	9	
Expediting	-----	7	
Estimating	-----	1	
Scheduling	-----	1	
Follow up	-----	1	
Routine drafting	-----	6	
" computation	-----	4	
" graph work	-----	2	
TOTAL		100	%

The results of the study shown above indicate that the engineers are spending 46 per cent of the day (or just under four hours) on clerical and nonengineering tasks. With these superfluous activities pinpointed and measured, steps can now be taken to alleviate this condition.

Fig. 5—Typical analysis based upon study

Among the main advantages of this method are the ability to obtain facts at one-third to one-sixth the cost of continuous observations, and the opportunity to acquire facts not usually secured by any other means.

As far as disadvantages are concerned, there seem to be none, except those applying to all time-measuring methods. The tendency for people to become uneasy when being observed doing their work can be overcome by proper indoctrination. In fact, a study such as this must be completely above-board from the very start. All concerned must be made fully aware of the reason for such a study. Otherwise, suspicion and resentment can create any number of difficulties.

Records and Forms Required: Assume that it is desired to make a study within an engineering department to determine utilization of engineering time. First, a work sheet is devised, Fig. 1, with a list of as many items as possible that are expected to be found among the engineering group's activities. Notice that the items shown as "routine" are comparable to what is normally considered as avoidable or unavoidable delays, that is, these are the "nonproductive" operations. In some engineering departments, these may be considered as normal engineering duties, and the listing shown should be considered only as a typical example.

Each of the items on the work sheet should be defined on data or job breakdown sheets as clearly as possible, so that observers and individuals being observed agree on identification of the activity as it is being recorded. For example, when a person is observed drawing sketches, it must be determined at the time of the reading whether

this person is "designing" (Item A-1), or "drafting" (Item C-7). Another case might concern an individual reading a newspaper (Item C-15). If he is reading the comics, it will have to be considered as "Idle Personal" (Item B). If it is technical information, it will remain as Item C-15.

Since sampling will be done at random, each run will not be started at the same place. A layout of the department is made, Fig. 2, and each engineering desk is numbered or identified to correspond to the stations on the work sheet. Each station is marked with an X, so that the observers will know the exact location for taking a reading.

Length of time required to complete the study and the amount of accuracy expected from the readings must be determined. For example, it is assumed necessary to run the study for four weeks, at which time it is expected that readings will have the accuracy desired. A sheet is maintained to tabulate cumulative daily readings, Fig. 3, and also a number of charts for plotting the individual activity readings, Fig. 4.

Making the Study: Observers make a quick tour of the department and note the work activities on the work sheets as they occur. Perhaps a half hour or so later (no preplanned time, since it is to be random sampling) another tour is made, but beginning at a different point than the first. This will continue throughout the day with no two succeeding tours following the same pattern.

If the study is well planned (as it should be), the observers will have determined beforehand a series of different routes or tours which will be followed throughout the study. Assuming 20 engineers are involved, each might be identified by number and each tour planned as follows:

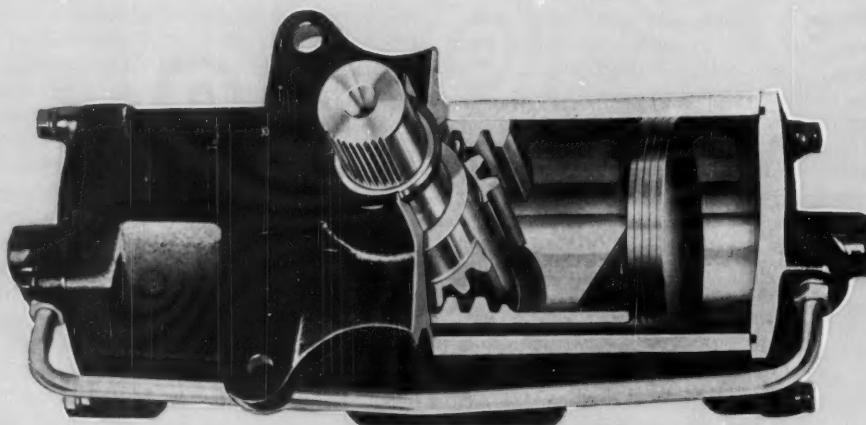

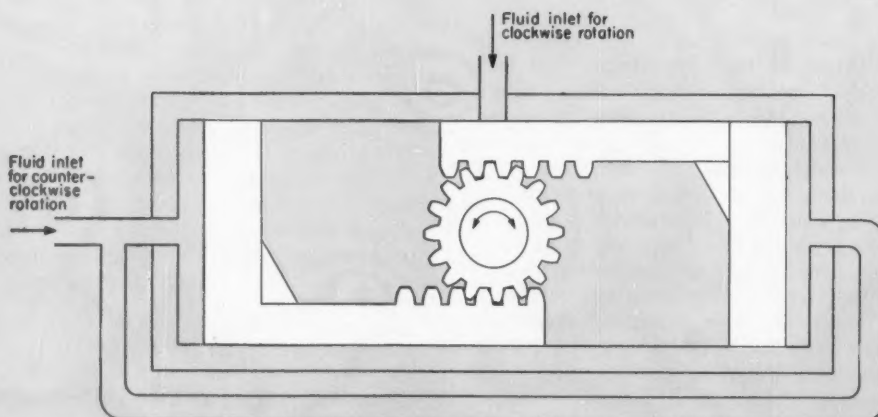

- Tour A = 15, 3, 8, 4, 6, 9, 12, 18, 1, 5, 7
- Tour B = 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 20
- Tour C = 19, 17, 15, 11, 16, 13, 14, 1, 18
- Tour D = 11, 2, 4, 6, 8, 10, 5, 9

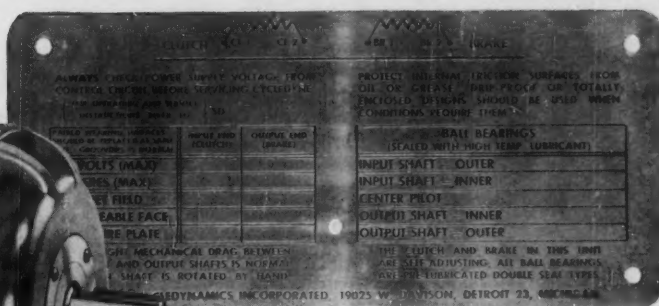

The actual length of the study is determined by how long it takes the values for the activities selected as most important to stabilize. A separate chart must be maintained for each activity studied, Fig. 4, but not all of the activities will warrant keeping records on. The readings begin to form a pattern after the first week of study. When the study has been completed, an analysis is made, Fig. 5. The analysis, based upon the completed study, quickly and accurately determines the true condition of the engineering department. As in the example given, the analysis may offer definite proof that assistance should be given the engineers in the form of clerks and technicians, and about how many will be required. On the other hand, the analysis could give entirely opposite results, revealing excellent utilization of available engineers and thus indicate that productivity of the department cannot be increased without additional engineering manpower. In either case, the analysis is frequently exactly the logical justification necessary to sell plans to skeptical management.

scanning the field for *ideas*

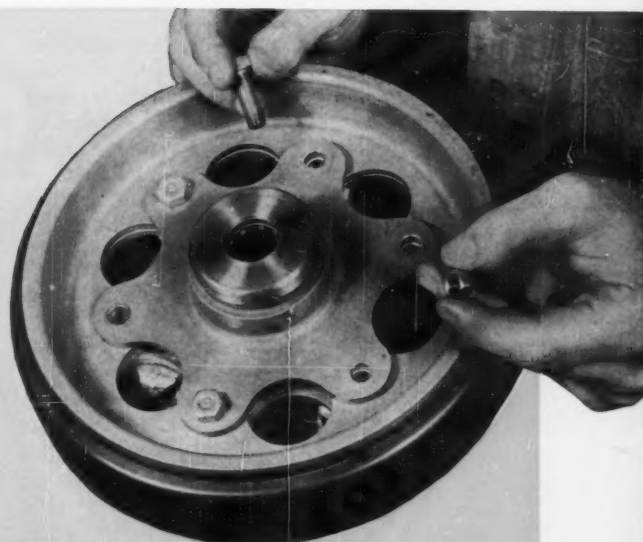

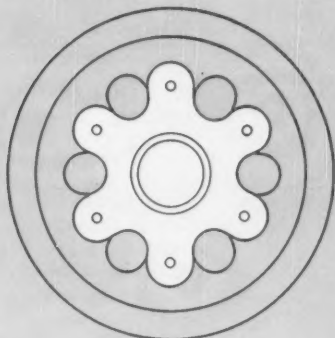

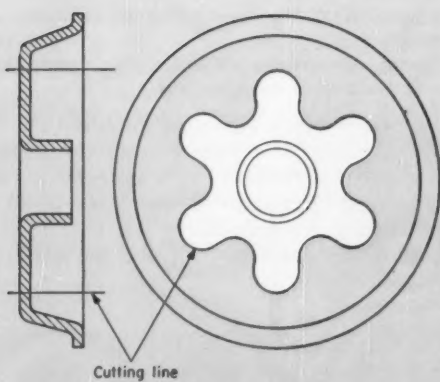

Opposed, internal gear rack elements are used to provide linear-to-rotary motion conversion in a power cylinder developed for hydraulic or pneumatic service. The design, developed by Thompson Products, Michigan Div., has two pistons, each with an integral rack projecting from

the inner face. The two racks mesh with a pinion mounted in the center of the cylinder. Fluid entering the ends of the cylinder forces the pistons and racks inward, turning the pinion and its shaft. Reverse rotation is obtained by forcing fluid between the pistons.

Dual-purpose nameplate also serves as junction-box cover with service data stamped on inside face. The inner face, protected from wear and damage, contains service, wiring, and maintenance data. Designed by Cycledynamics Inc., the nameplate must be removed to provide access to wiring.

Jigsaw construction of wheel hub and flange elements offers advantages in production and assembly operations. In this design, mating hub and flange halves are produced as one piece, then cut apart in a gear-like design. By rotation of the hub half, the "teeth" of hub and flange overlap to provide contact surfaces for joining by bolts. The design was developed by Rapids-Standard Co. Inc. for a demountable-rim wheel.

USING DIGITAL COMPUTERS

Design engineers often find that paths to finished products lead through masses of routine calculations. They're essential, but they're also a burden. Anything to lighten the load is welcome.

Today, help is here in the form of digital computers. What they now do and what they will do for the designer is the subject of this article—the practice, problems, and possibilities of computerization.

BEFORE computers, the design engineer used to spend a lot of time on hand calculations. Often, this work consumed all his working day. Now, however, computers can assume most of this burden. One result is the opportunity to upgrade design men to jobs which require them to think creatively 90 per cent of their working time instead of spending 40 per cent in standard calculations.

► Current Practices

The design engineer is frequently required to specify properties and capabilities of proposed new products. He often does this by reviewing previous designs. If something close is available, he scales up the new design from the old one. Without a computer, this is time-consuming, slide-rule work.

For example, in electrical rotating machinery, a new generator may be "ratioed up" from an old design. However, special requirements such as low harmonics, high efficiency or an odd voltage may take still more time. If the design is a motor, the torque requirements may require tedious design work and difficult decisions, since high starting torque and low inrush current are opposite requirements. Also, calculating torque-speed curves is slow work with complex numbers.

Once the "slide rule slavery" is over, the en-

gineer must fill out drafting instructions and then manufacturing instructions.

The word *ratioing* is important because all large electrical equipment manufactured in "lines" has certain available punchings and a choice must be made of one for a new design. The job is one of analysis—choosing the most appropriate punching, and analyzing the rating to see if it fits the punching. For small machines, where new punchings are inexpensively created, the design procedure is more flexible and a new design may be "synthesized" to meet customer requirements.

Search and Synthesis: Now let's see what the computer can do in this case. First, consider the problem of a suitable design. Most electrical machinery manufacturers have a wide variety of designs already prepared and it is only a matter of finding the one most nearly suitable. A computer makes possible two courses of action:

1. Prepare a "filing-clerk" deck to seek out a design.
2. Ignore previous designs and simply design the new machine to specifications.

Most people today use computer design decks simply to augment presently available designs. When a search of file books fails to reveal the necessary design, then the computer deck is set to work preparing new designs.

However, the computer can also eliminate the

Table 1—Typical Inputs and Results

	Computer Inputs	Computer Outputs
Analysis	Wire sizes Punching dimensions Rating	Flux densities Losses/efficiency Excitation requirements
Synthesis	Flux densities Losses allowed; Efficiency Excitation allowed Starting current	Wire sizes Punching dimensions Weight Cost

By JOHN R. M. ALGER

Manager, Advance Technical Programs
Engineering Services
General Electric Co.
Schenectady, N. Y.

manual search of file books. This is done by successively eliminating specified variables, using the choice or logic circuits. A desired product may be a synchronous motor design of 1200 hp, 6 poles, 60 cps, and 0.8 power factor. The computer deck is set up to eliminate one variable at a time. First, the horsepower rating is compared to every other rating, one at a time. This comparison might simply be subtracting 1200 from the compared rating. Naturally, when 1200 is reached, a zero is obtained which signals the computer to shift to a new location (storage) instead of proceeding further on horsepower.

The new location causes the computer to search poles. When 6 is reached, in this case, another shift occurs. Eventually (actually in, say, 10 sec or so), we arrive at a storage location for which horsepower, poles, cycles and power factor are correct. This location then directs the computer to point out a series of numbers designating all the designs that meet the desired specifications. If the computer were large enough, the actual designs themselves would be provided. Thus, the design engineer would have all previous designs that meet certain of the specifications.

What the computer does, essentially, is to cull over all the available designs, gradually eliminating until all desired specifications are met. It would be entirely possible to establish a variable number of specifications. For example, if 6 criteria were set, but did not yield a design, the process could

be repeated with 5 criteria. If a wider spread of designs is desired, only 3 or 4 specifications need be set.

Presuming the computer to have gone through the files without success, the design engineer then asks the computer to design a machine for him—essentially a process involving synthesis as shown in Table 1.

Synthesis consists essentially of obtaining a material list and design instructions from specifying the required output. Analysis is considered to be the reverse.

Computer decks can be set up to combine synthesis and analysis. For example, a synchronous motor may be computer-designed in a certain punching, except that the computer is asked to try various damper windings in order to come up with acceptable starting and maximum torques. Once the computer has provided the design engineer with a generally suitable paper machine, he will ask further for calculation of many ranges of data such as:

Reactances	Vee curves
Time constants	Regulation
Harmonics	Losses
Load-saturation curves	Torque-speed curves

Program: The digital computer has advanced tremendously in the last five years. Programming a computer is now extremely simple so that the time spent is mostly used in setting up the equations and debugging. General procedure is shown in Table 2. Preparation of a major design deck for a machinery section may require between 300 to 600 engineering man hours. The time would be divided up approximately as Table 2 shows, except that the coding would be done by an engineering assistant working with the engineer.

For the computer specialist it is sufficient that the results and program be in computer language. For example, 04 1950 1060 might mean "Add core loss to copper loss." But for the design engineer, and all others not continuously close to computer technology but primarily interested in the results, the above step should be printed out as stated: Add core loss to copper loss. Equipment to perform this step automatically is gradually becoming available. When fed the written instruction "Add core loss to copper loss," the machine will know what to do. For its own consumption, the machine may have to translate to computer language first, but it will do this automatically. The results will be a printed statement that reads:

1. Copper loss in stator	1500 w
2. Core loss in stator	700 w

In computer language, the results might read 5315000000, 527000000. To translate, a position

Example—Two Computers Find Motor Rotor Temperature

Less complex computers, like those of early design, are able to do arithmetic and thereby lift many burdens from the engineer because many of his calculations reduce to addition and subtraction. For example, suppose the temperature of a motor rotor is to be calculated with the equations:

$$r = r_0(1 + \alpha t) \quad (1)$$

$$Q = i^2 r \quad (2)$$

$$t = RQ \quad (3)$$

where:

r_0 = Rotor resistance at base temperature

r = Rotor resistance at temperature t

α = Temperature coefficient of resistance

i = Rotor current

Q = Power loss in rotor

R = Thermal resistance between rotor copper and air

t = Temperature of rotor copper

A temperature t must be assumed to calculate r . With this resistance Q is calculated and then t . If t is a poor guess initially, the calculated value of t will be poor and recalculation is necessary, using a new answer for t .

For example, let:

$$r_0 = 1$$

$$\alpha = 0.004$$

$$i = 10$$

$$R = 0.10$$

$$t \text{ (initial)} = 2$$

Substituting in Equations 1, 2, and 3:

Step 1

$$r = 1[1 + (0.004 \times 2)]$$

$$= 1.008$$

$$Q = 100 \times 1.008 = 100.8$$

$$t = 0.10 \times 100.8 = 10.08$$

Step 2

$$r = 1[1 + (0.004 \times 10.08)]$$

$$= 1.0403$$

$$Q = 100 \times 1.0403 = 104.03$$

$$t = 0.10 \times 104.03 = 10.403$$

Step 3

$$r = 1[1 + (0.004 \times 10.403)]$$

$$= 1.0416$$

$$Q = 100 \times 1.0416 = 104.16$$

$$t = 0.10 \times 104.16 = 10.416$$

This process can be continued indefinitely, but since the change in t between Steps 2 and 3 is less than 0.2 per cent, a sufficient answer is available.

When these steps are performed on an early digital computer, the operator must look at the answer for t between each step and feed back into the com-

puter, by hand, the new value of t . This procedure is good, as far as it goes, but it requires a human brain to be available at each small decision-making point.

A considerable improvement on the earlier machine is the internally programmed machine which can:

1. Make decisions (i.e. choose one of any number of possible paths of next action)
2. Implement the decisions (i.e. take the next action)

In the problem just worked, the newer machine will compute a trial value of t , calculate a step, compare the answer to the previous one, recalculate if necessary, or stop if the answer is as close as desired to a "true" answer.

The computer can be told to proceed as the table shows.

In such a simple problem, it would have been simpler to put Equations 1 and 2 into 3 and get the exact value 10.444. But in the usual thermal circuit problems of machinery, a network of resistance elements is involved for which the equations become exceedingly complicated if the exact solution is attempted. However, an "iterative" technique, as illustrated, works simply and rapidly (electronic speed). The design engineers need only specify the equations and philosophy of solution in words (as the example shows). An engineering assistant will pick up the problem from there and carry it out, giving back the answers the computer provides.

Process	Program
1. Calculate an initial value of t .	$t = 2$ (assumed)
2. Calculate t (go through Step 1).	$t = 10.08$
3. Calculate the per cent change in t .	Change, % = $\left(\frac{10.08 - 2}{2} \right) 100 = 404$
4. Is this change less than 0.2 per cent?	$404 - 0.2 = +$
5. Since the answer is no (i.e. plus), put the calculated value of t back and recalculate t .	$t = 10.403$
6. Calculate the per cent change in t .	Change, % = $\left(\frac{10.403 - 10.08}{10.08} \right) 100 = 3.2$
4. Is this change less than 0.2 per cent?	$3.2 - 0.2 = +$
5. Since the answer is no, put back recalculated t and recalculate again.	$t = 10.416$
6. Calculate the per cent change in t .	Change, % = $\left(\frac{10.416 - 10.403}{10.403} \right) 100 = 0.125$
7. Is this change less than 0.2 per cent?	$0.125 - 0.2 = -$
8. Since the answer is yes (i.e., minus), stop and provide the answer.	

decoder is needed and the decimal notation must be remembered.

Capacity and Capability: Especially in large companies, computer time is now readily available. Computer centers at universities and business machine companies also offer computer facilities. Many problems or parts of problems can be solved immediately. Decks are available for obtaining roots of polynomials of any order, and for solving simultaneous equations, algebraic or differential. Further, the special-purpose program decks of many company components are on hand and available.

Computer decks can be designed to handle wide ranges of machines. Recently, the electrical design and critical speed were needed on a new high-speed aircraft generator. It happened that a deck was available which provided critical speeds, but the deck was originally intended for shafts of many times the size of the aircraft generator. Likewise, an electrical excitation calculation deck was available, but it was normally used in 10,000 to 50,000 kva generators. It readily provided the same data for the 40 kva machine.

► Problems Computers Pose

Programming: Naturally, the computer poses some problems of its own. One is: Who is to program the computer? It is generally preferable that all engineers, both managers and specialists, acquire the ability to supervise the programming of their problems rather than allocate the entire problem to a computer staff. This policy holds the computer staff to the economical minimum needed to perform routine programming and to operate the machine.

Design engineers should be asked to supervise and carry out the computerization of existing calculation methods. Development engineers should carry on new work to capitalize on the accuracy that can be obtained. Management must realize the time and money involved in programming and debugging computer decks.

This requires first-hand knowledge of computer language. Roughly 8 to 10 months must be available to prepare the engineering force of a medium-size company to use a medium-size, internally programmed computer.

Assignment: Sometimes an alliance of the accounting and engineering forces facilitates the computerization of work. This may start off as an agreeable arrangement but usually becomes unworkable due to differences in the requirements of engineering and finance. Engineering usually needs computer time at odd hours, and immediately or not at all. This is the nature of requisition and proposition work. Accounting requires the same time regularly (i.e., the payroll must get out).

Co-operation can perhaps be enhanced by allotting to engineering some small but regular time which must always be paid for even though not

used. Generally speaking, as the computer load grows, engineering and accounting should go their separate ways. Further, a scientific computer does not have the same fittings as a straight business machine.

Confirmation: One problem may arise which has not yet been seen because of computer newness. That is the question: What is the computer doing? The origins of design methods tend to become obscure. As a result, engineers use rules of thumb and design equations by rote rather than knowledge. This is a trap, because assumptions made can vitiate the use of such results in certain cases.

An example is the averaging method of calculating speed torque curves for synchronous motors. The torque dip at half speed is not correctly represented by the calculation method and could lead to a half-speed crawl in test if not recognized in time.

The computer makes greater, not less, the possible danger of past design methods. For now, the computer has the brains and may tend to seem inviolable. It is easy to design by computer without thought to the limitations of particular design decks. The assumptions and limitations of the decks should be carefully documented. Such documents should be required reading for persons using the decks.

Correction: Ease of computerization and usefulness of results have increased one burden rather than decreased it. That is debugging. One may program a problem, and if it is at all complicated, the answers will not agree with check points at the first or second try. Therefore, in computer decks of any size, it is well to use the means provided to self-check the decks.

If, by error, an operator tells the machine to do something it cannot, for example, it will stop and state its problem (in lights) and tell where within the computer deck the trouble lies. Almost any error can be detected by the machine itself so it can inform the operator of the trouble and show where it is. Of course, the next step is self-correction within the machine.

Cost: It takes courage for management to accept the immediate high cost of a computer because it is not possible to balance the suddenly increased cost against correspondingly reduced manpower or increased efficiency. One cannot check off this and that job because the computer arrives. New jobs are created. The computer must be accepted as progress for which the payoff will come gradually.

The cost of computerization is roughly \$50 per

hour for a medium-size, internally programmed machine. However, with proper preparation of input material and training of personnel, the time invariably can be well spent.

► Possibilities for Computers

Refinement of Estimates: Prior to the introduction of computers, lack of manpower and lethargy caused some items in engineering quotations to be estimated or ignored. Now, with computers, it is easily possible to study the effects on performance of varying each of the input data. Effects one at a time, two at a time, or n at a time may be studied.

Design Optimization: A new possibility opened up by computerization is optimization of design within allowable time limits. In design quotations, time permitted the design engineer to make only one or two quick calculations and then a decision. By computer he can obtain all the possible designs or an optimized design from an optimizing computer deck. A common optimizing criterion is cost. For military applications it may be weight or output.

An example of design optimization is that of air-

craft generator weight which varies with reactance. An optimizing deck provides the lightest weight machine. Without the deck, time would not permit making enough comparable designs to be certain of obtaining the optimum.

System Optimization: Further, the computer opens up to the design engineer the possibility, eventually a competitive necessity, of system optimization. Any machine is but a system component. Several machines plus controls often constitute the package sold. An optimum system would meet the system specifications on cost, for example, and one other property, the two being considered simultaneously. Properties other than cost could be losses, response time, or output (rated and maximum).

A Look Ahead: It will not be long before routine designs are carried out completely on a computer. Starting with customer requirements, the computer will furnish manufacturing instructions and drawing numbers. Actually, causing the computer to issue drawings is a procedure now under development.

The advances of digital programming into manufacturing, in such forms as a card-instructed lathe or milling machine, suggest the idea that the customer may eventually specify his requirements and actually receive his neatly optimized apparatus from a completely automatic factory which devours instructions and raw materials to produce end products directly.

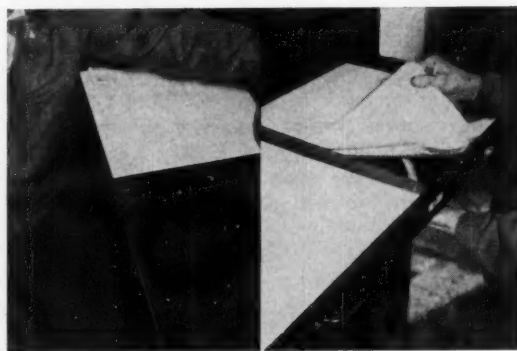

Tips and Techniques

Lines on Corrected Sepias

The difficulty of producing clean, dark lines on sepia after the undesired portion of the drawing has been bleached out can be readily overcome. The desired lines are drawn on the sepia, right over the lines to be removed, just as if using a clean sheet of paper. Then, the old linings are bleached out, leaving clean, dark lines. Using this method, it is not necessary to worry about tearing the soft, wet paper nor to wait until the paper dries as the drawing is finished. Good scale is insured as the predrawn lines will shrink with the sepia during bleaching.—ED L. GOULD, *Hickman Mills, Mo.*

Locating Drawings

Addition of a 1-in. diam hole, located in the bottom and title block corner of each tracing compartment of tracing-file drawers, provides a convenient method of locating tracings anywhere in the pile. This hole eliminates "dog-eared" corners on tracings, because the title block corner of the

entire pile is lifted from the compartment by inserting a finger through the hole. The hole is easily installed using a 1-in. diam hole saw.—THOMAS C. ROSTRON, *Schramm Inc., West Chester, Pa.*

Ground Rules for Determining or Comparing

BEARING CAPACITY RATINGS

- ▶ What they are
- ▶ How they are determined
- ▶ Their use in bearing selection

By **LEO FIDERER**

Senior Development Engineer
Control Instrument Co. Inc.
Brooklyn, N. Y.

DIFFERENT methods are used to give load ratings for bearings made by different manufacturers. Thus, a comparison of the capacities of similar bearings made by different manufacturers is a difficult task. However, an understanding of the principles underlying the standards by which bearing-capacity ratings are established will simplify the selection process.

▶ Fatigue

If a load on any structure is applied repeatedly and alternately from opposite directions, it causes

a continuous reversal of stresses. Gradual deterioration of the material due to these stress reversals eventually causes breakdown of the material structure. This fatigue failure may occur although the applied stress is well below the elastic limit. The number of stress repetitions or stress reversals is the critical factor in fatigue failure.

When a ball or roller bearing is running under load, each point on the race over which the rolling elements pass is alternately under compressive and tensile stress. Therefore, each revolution causes a definite number of stress reversals which will eventually lead to bearing failure. If the bearing is correctly lubricated, mounted, and protected from dust and other foreign matter, fatigue is the only cause of failure.

Nomenclature

B = Bore diam, mm or in.
 b = Load-ratio exponent
 C = Specific dynamic capacity, lb
 C_s = Specific static capacity, lb
 D = Outside diam, mm or in.
 D_m = Mean diam, mm or in.
 F_a = Axial force, lb
 F_r = Radial force, lb
 L_h = Bearing life, hr
 L_n = Fatigue life, millions of revolutions
 N = Speed, rpm
 P = Equivalent radial load, lb
 R = Radial capacity, lb
 T = Torque, lb-in.
 W = Width, mm or in.
 μ = Coefficient of friction

▶ Bearing Life

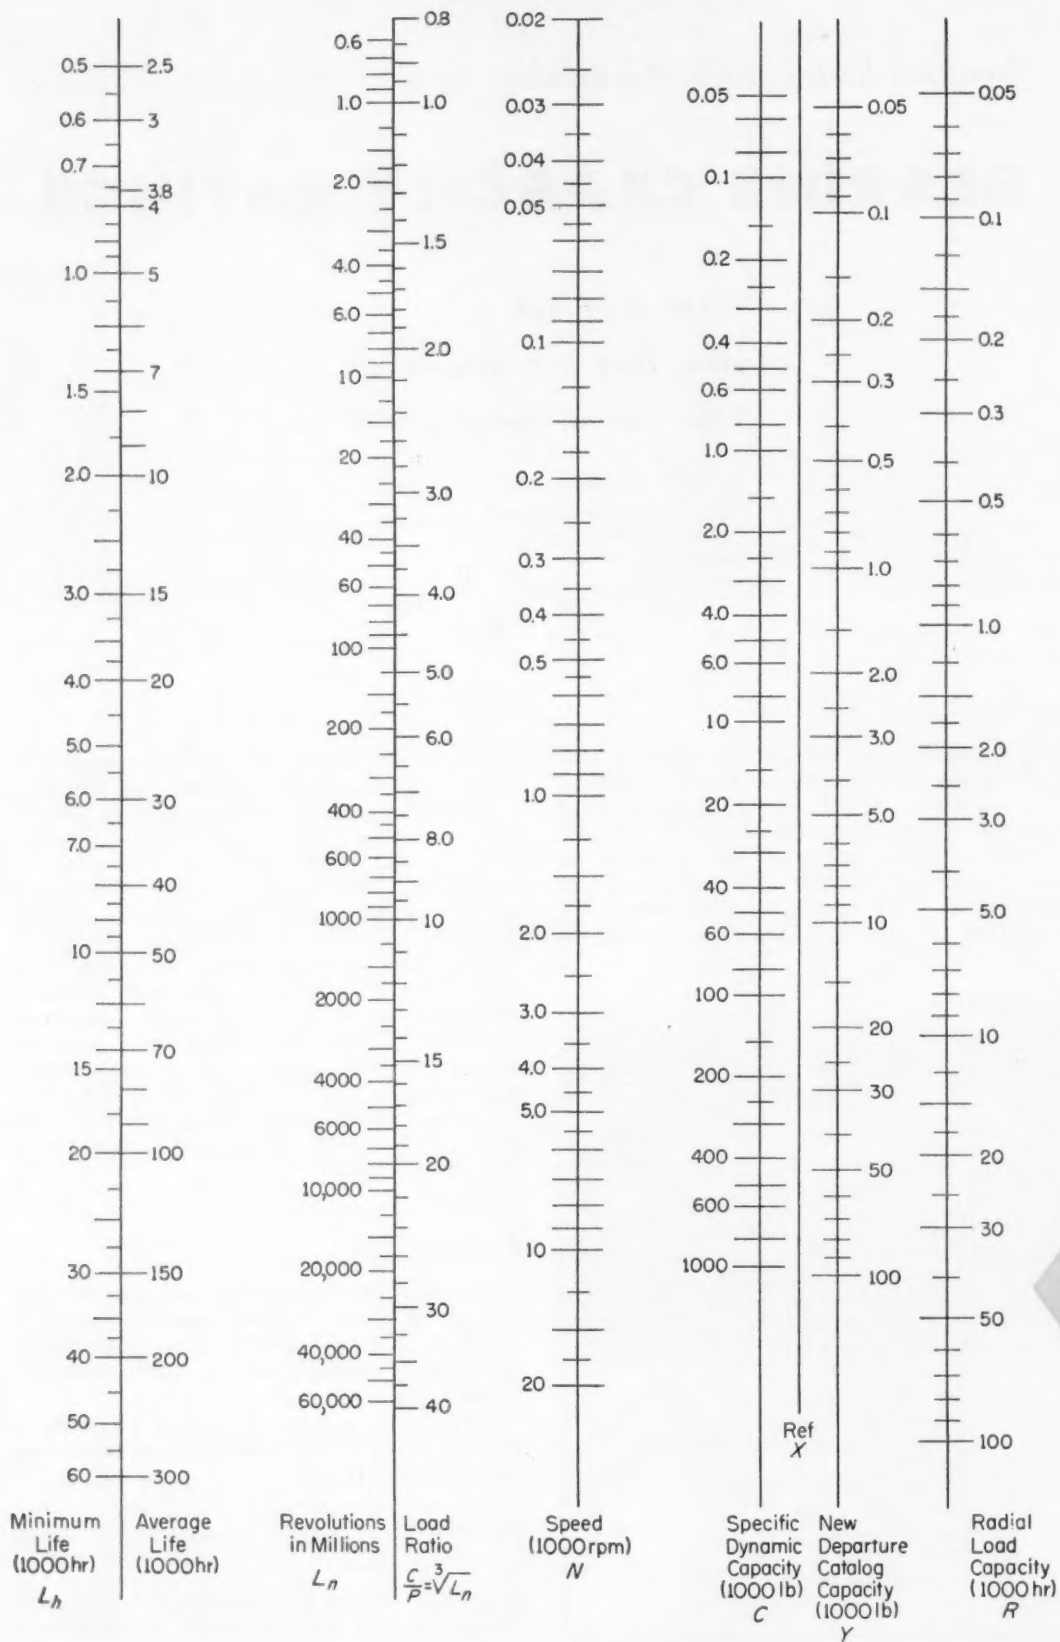

The number of revolutions required to cause fatigue failure of a bearing under a certain load is called the "fatigue life" of the bearing. Because of the large numbers involved, life is commonly expressed in millions of revolutions.

Bearing life, in terms of time, is a function of both the speed and the fatigue life of the bearing and is expressed as

$$L_h = N \left(\frac{L_n}{60} \right) \quad (1)$$

From this equation, it is apparent that for a given fatigue life and load, the hours of operation of

Fig. 1—Bearing Capacity Nomogram

a bearing are inversely proportional to the speed.

Despite the high precision, uniformity, and quality obtained in the manufacture of bearings, differences in the life of apparently identical bearings are unavoidable, due to manufacturing and material variations. If a large group of seemingly identical bearings are run under the same load, speed, and operating conditions, some bearings will fail early, while others may last four times as long as the average of the group.

Many bearing manufacturers have conducted ex-

tensive tests on bearing life. Data from such tests give a fair indication of the percentage of bearings in any group that will reach a certain life. One of two methods of determining life expectancy is used by most bearing manufacturers. Some use the "minimum life" (B-10 life). This signifies that 90 per cent of any large group of bearings of the same type and size will have a life longer than the rated life, and 10 per cent will fail before that life is reached. Other manufacturers use the "average life," i.e., 50 per cent will exceed the rated life, while 50 per cent will fail before the rated life is attained. The average life is five times the minimum life. Before comparing load ratings, the designer has to ascertain, from the manufacturer's catalog, which of the two rating methods is used.

The choice between the two life-rating methods demands special care. For example, in machines that require continuous, dependable service, it would be sound practice to use the minimum life for the basic rating of the bearing. The "average life" implies that there is one chance out of two that the bearing would fail before the rated life is reached.

Bearing replacement would not only involve the bearing cost, but also the expense of disassembly and reassembly of the machine. More important, the cost of lost production time, when the machine is stopped for maintenance, is often prohibitive.

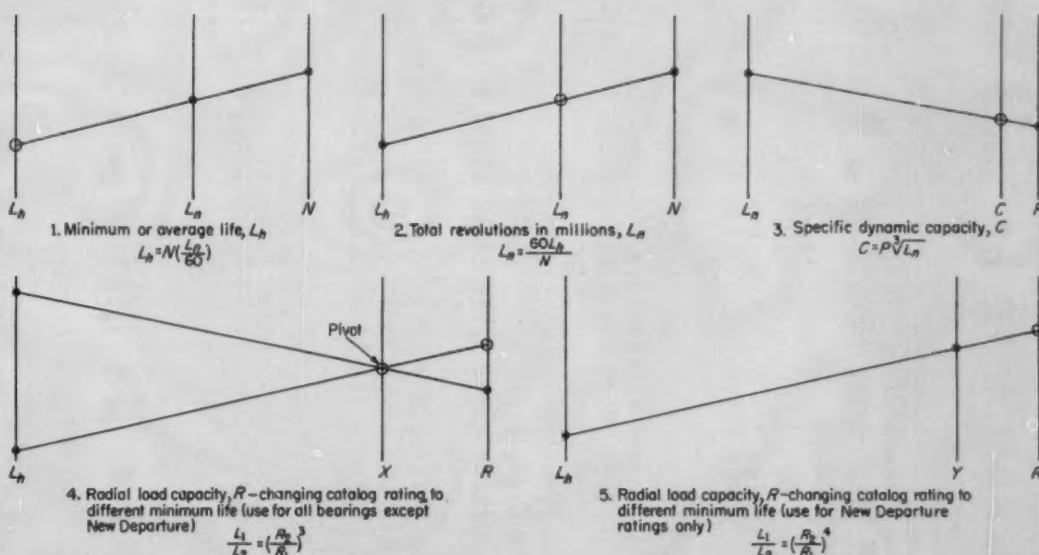

On the other hand, in mass-produced items and when the bearing can be quickly and easily replaced, as in automobiles, it is often advisable to use the average life for the basic rating. This

Table 1—Recommended Bearing-Life Values

Type of Application	Bearing Life, L_h (hr)
Instruments and apparatus for infrequent use: Demonstration apparatus, devices for operating sliding doors	up to 500
Aircraft engines	500 to 2000
Machines for short or intermittent operation, where service interruption is of minor importance: Hand tools, hoists, hand-driven machines, farm machinery, assembly cranes, charging machines, foundry cranes, household appliances	4000 to 8000
Machines for intermittent service where dependable operation is of great importance: Auxiliary machines in power stations, work-moving devices on production lines, elevators, general-cargo cranes, less frequently used machine tools	8000 to 14,000
Machines for 8-hr service which are not always fully utilized: Stationary electric motors, general-purpose gear drives	14,000 to 20,000
Machines for 8-hr service which are fully utilized: Machine tools in general, continuous-service cranes, blowers, jackshafts	20,000 to 30,000
Machines for continuous (24-hr) service: Separators, compressors, pumps, roller conveyors, mine hoists, stationary electric motors	50,000 to 60,000
Machines for continuous (24-hr) service where dependability is of extreme importance: Cellulose and paper machines, public power stations, mine pumps, public pumping stations	100,000 to 200,000

Method of Solution

is especially important when the cost of the product has to be kept at a minimum for competitive reasons.

Table 1 gives the minimum bearing life to be used in various types of machinery. Of course, the designer's judgment has to be used in each decision on bearing life. Generally, the bearing should serve as long as the other machine components.

► Relation Between Load and Life

From tests conducted by many bearing manufacturers, a definite relationship between the applied load and the fatigue life of the bearing has been

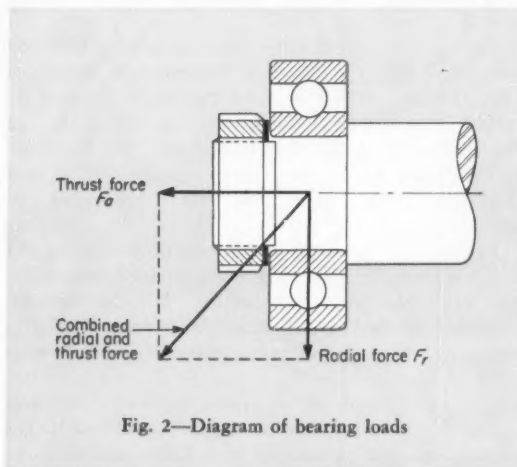

Fig. 2—Diagram of bearing loads

established. If a group of test bearings is run under a constant load, P_1 , and another group of bearings of the same size and design are run under load P_2 , but otherwise under identical operating conditions, the lives, L_1 and L_2 respectively, may be obtained for these groups. The relation can be stated with fair accuracy as

$$\frac{L_1}{L_2} = \left(\frac{P_2}{P_1} \right)^b \quad (2)$$

The exponent, b , varies for different manufacturers. The majority of bearing manufacturers (McGill, SKF, MRC, Norma-Hoffman, Fafnir, and others) use $b = 3.0$. Notable exceptions are New Departure, which uses $b = 4.0$, and Timken ($b = 3.33$).

There is a growing trend among bearing manufacturers to adopt a standard method of rating bearing capacities. For this purpose, the concept "specific dynamic capacity" (sometimes called "basic dynamic capacity" or "specific capacity") was introduced. By definition, the specific dynamic capacity, C , is the radial load in pounds that will give the bearing a minimum life of 1 million revolutions of inner-ring rotation. This corresponds to a life of 500 hours at $33\frac{1}{3}$ rpm.

From the definition of C , using $L_1 = 1.0$ million revolutions and $b = 3.0$, Equation 2 can be transformed into

$$L_n = \left(\frac{C}{P} \right)^3 \quad (3.1)$$

$$\frac{C}{P} = \sqrt[3]{L_n} \quad (3.2)$$

This equation is called the "classic-life formula."

Table 2—Typical Specific Dynamic-Capacity

Basic Bearing Number	Bore Diameter		Single-Row Deep-Groove			Double-Row Deep-Groove		Self-Aligning	
	(mm)	(in.)	Extra Light	Light	Medium	Light	Medium	Light	Medium

Table 3—Popular Ball and Roller-Bearing Types

Bearing Type	Characteristics	Principal Applications	Approximate Equivalent-Load Equation Inner-Ring Rotation	Outer-Ring Rotation
Single-Row Deep-Groove Ball Bearing 	Most commonly used general-purpose ball bearing; can sustain radial load and considerable thrust load in either direction at high speeds. Is available with built-in seals or shields to exclude dirt and retain lubricant, or snap rings to reduce assembly and housing costs.	Machines of all types. Very small sizes often used in instrumentation.	$P = F_r + F_a$	$P = 1.2F_r + F_a$
Single-Row, Filling-Notch Ball Bearing 	Because of filling notch (loading groove), larger number of balls can be inserted than in deep-groove bearing of same size and has about 25 per cent higher radial capacity. Has very little thrust capacity. Recommended for radial loads only or small thrust loads in combination with radial loads.	General purpose applications with heavy radial load.	$P = F_r$ Note: F_a must be less than $F_r/4$	$P = 1.2F_r$ $P = 1.2F_r + F_a/4$
Angular-Contact Single-Row Ball Bearing 	High shoulders provide for heavy thrust loads in one direction or radial load in combination with thrust load. At very high speeds, this bearing is preferred to ball-thrust bearings, even for pure-thrust loads. When mounted singly unopposed or in tandem, constant axial load in one direction is required. Otherwise, use opposed mounting in pairs or duplex bearings (back-to-back or face-to-face) to absorb thrust loads in either direction. Increased axial and radial rigidity is obtained by preloading.	High-speed machine tools, grinding spindles, automotive front-wheel bearings, worm drives.	Singly Unopposed: $F_a > F_r$ $P = 0.3F_r + F_a$ Tandem Mounted: $F_a > F_r$ $P = F_r + 0.6F_a$ Duplex Mounted: $F_a < 1.4F_r$ $P = F_r + 0.5F_a$ Duplex Mounted: $F_a > 1.4F_r$ $P = 0.3F_r + F_a$	$P = 1.2F_r + 0.3F_a$ $P = 1.2F_r + F_a$ $P = 1.2F_r + 0.5F_a$ $P = 0.36F_r + F_a$
Double-Row Ball Bearing 	Available either as angular-contact or as deep-groove bearing. Both types have grooves positioned for outwardly converging contact angle similar to back-to-back duplex bearing. Has high axial and radial rigidity, substantial thrust capacity in either direction and high radial capacity. Requires very accurate alignment of housing and shaft.	Shafts for worm, spiral, bevel and helical gears, idler pulleys, live centers.	$P = F_r + F_a$	$P = 1.2F_r + F_a$
Self-Aligning Ball Bearing 	Two rows of balls roll on spherical surface of outer ring. Supports radial loads and moderate thrust loads in either direction at high speeds. Can sustain angular misalignment up to 3 deg without detriment, while running. Used where errors in mounting, distortion of housing, large angular shaft deflection, etc., are unavoidable. Cannot resist bending loads.	Woodworking and agricultural machinery, line shafts, long transmission shafts, pillow blocks.	$P = F_r + 3F_a$	$P = F_r + 3F_a$
Spherical-Roller Bearing 	Self-aligning with barrel-shaped rollers and spherical raceway in outer ring. Carries heavy radial loads and heavy thrust loads in either direction. Considerable capacity to absorb shock loads. Popular in larger sizes.	Heavy machinery, rolling mills, stone crushers, printing presses, heavy-duty pillow blocks, railroad journals, drive shafts on ships.	$P = F_r + 3F_a$	$P = 1.2F_r + 3F_a$
Cylindrical-Roller Bearing 	Very high radial capacity and suitable for high speeds. Available with guide flanges on outer, inner, or both rings. With flanges on one ring only, some free axial movement of shaft is permissible. With flanges on both rings, only small locating thrust loads can be accepted. Is not recommended for other thrust loads because of high side friction. Requires very accurate alignment of housing and shaft.	Machine-tool spindles, transmission shafts, gas turbines, aircraft engines.	$P = F_r$	$P = 1.2F_r$
Needle Bearing 	For small radial space between housing and shaft. Sometimes inner or outer race is omitted and needle rollers run directly on hardened shaft or housing bore. Requires very accurate alignment of housing and shaft. Higher internal friction, lower speed limits, and greater diametral looseness than ball bearings. Usually has no cage.	Crankpins, wristpins, rocker arms, universal joints, cam rollers, compressors, aircraft controls.	$P = F_r$ No thrust load permissible	$P = 1.1F_r$
Tapered-Roller Bearing 	High axial and radial rigidity and heavy load-carrying capacity. Mounted opposed in pairs similar to angular-contact ball bearings. Accurate adjustment of internal clearance possible. Requires accurate alignment of housing and shaft, and skillful assembly.	Automobiles, heavy machine tools, railroad cars, steel-mill equipment, worm drives.	See manufacturer's catalog	
Ball Thrust Bearing 	For heavy thrust loads in one direction only, where minimum axial deflection is desired. Because of centrifugal forces, not recommended for high speeds and light loads. Radial load must be carried by other bearings. Flat seats provide accurate axial location; spherical seat is used when slight angular misalignment of shaft is present.	Machine tools, crane hooks, vertical rotating members.	$P = F_a$ No radial load permissible	
Spherical-Roller Thrust Bearing 	Can carry heavy thrust loads, is self-aligning, can operate at high speeds and accept slight radial loads when combined with thrust load.	Turntables, large crane hooks, water turbines, ship-screw thrust bearing, heavy pumps.	F_a must be $> 1.5F_r$ $P = 2F_r + F_a$ At high speeds, F_a must be $> 2F_r$	

It has been incorporated into the standards established by the Anti-Friction Bearing Manufacturers Association, and is also used in many European countries.

The life formula can be readily used in cases where the speed is not constant, but where the total number of revolutions is significant. In vehicles, for example, the number of revolutions can be easily related to the number of miles traveled. As any motorist knows, the intervals of wheel-bearing replacement or relubrication are measured in terms of miles traveled, regardless of the speed and number of hours. Equation 3.2 is especially convenient because it readily establishes the ratio between the specific dynamic capacity and the permissible load. For example, if the expected minimum life is 8 million revolutions, then $L_n^{1/3} = 8^{1/3} = 2$, and the required specific capacity has to be twice the applied load.

Specific dynamic capacity values for bearings of one manufacturer are given in Table 2. Interchangeable bearings by different manufacturers vary in internal construction, but the values in Table 2 are representative of the capacity and life expectancy of typical bearings. This table can be used, at least, as a guide for preliminary estimates. After the load, speed, desired life, and bearing type are decided upon, the value of C can be found using Equations 1 and 3.1. The corresponding bearing size is then selected from Table 2. If the calculated C value falls between two values on the table, the next larger size is selected.

► Equivalent Load

Under ordinary running conditions, a bearing very seldom carries only pure radial load or pure thrust load. In most cases, the load is a combination of both. Before selecting a bearing, these loads should be determined as accurately as possible. Calculations should take into account the torque transmitted by the shaft, weight of supported components, centrifugal and inertia effects, etc. In most radial bearings, the endurance of the

inner ring against fatigue is lower than that of the outer ring. Therefore, their load conditions are different.

To extend the use of the life formula to calculations involving thrust loads, simultaneous radial and thrust loads, and cases where the outer ring rotates relative to the load, the "equivalent load" must be established. By definition, the equivalent load is that constant, stationary radial load which, if applied to a rotating inner ring, would give the same life as that which the bearing would attain under actual conditions of load and rotation.

Calculation of the equivalent load, P depends on the type of bearing, its internal construction, and the ratio between the axial and radial-load components. Some common bearing types, their characteristics, and approximate equations for estimating the equivalent load are given in Table 3. These equations are mostly on the safe side and can be used for comparison of the life of various bearings. For less approximate calculations of equivalent loads, the manufacturer's catalog has to be consulted for each individual bearing series.

The load-calculation methods given imply ideal conditions of steady, constant loading. In actual practice, the equivalent load has to be multiplied by an application factor to take into account conditions of shock, vibration and severity of service. This factor may vary from 1 for light rotating machines, free from shock, to 3 for reciprocating machines with heavy impact. If the load varies gradually and uniformly from minimum to maximum at constant speed, the effective equivalent

Table 4—Approximate Friction Coefficients

Bearing Type	Coefficient μ
Self-aligning ball bearing	0.0010
Cylindrical roller bearing	0.0011
Thrust ball bearing	0.0013
Single-row ball bearing	0.0015
Tapered-roller bearing	0.0018
Spherical-roller bearing	0.0018
Needle bearing	0.0045

From Ref. 5

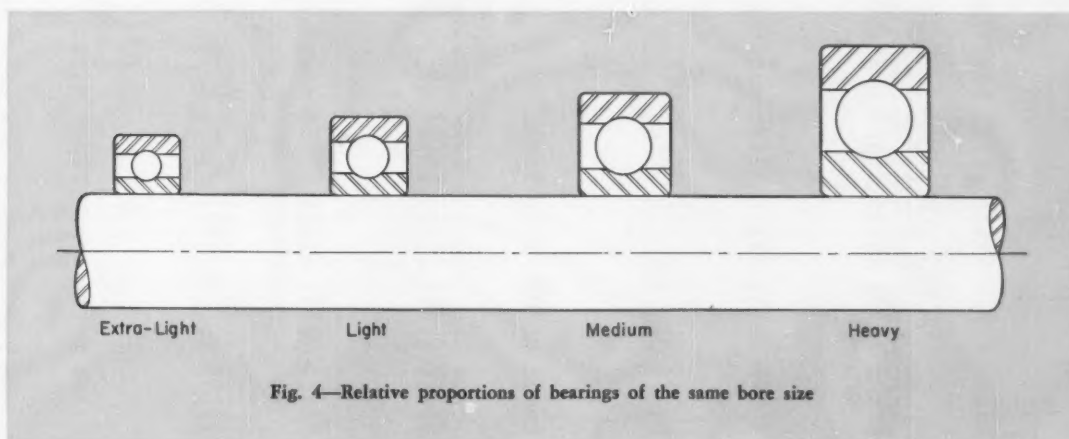

Fig. 4—Relative proportions of bearings of the same bore size

load can be found by

$$P_{eff} = P_{min} + \frac{2(P_{max} - P_{min})}{3}$$

In oscillating bearings, the life can generally be calculated on the basis of the oscillations per minute being equal to the revolutions per minute except for small angles of oscillation (less than 60 deg). In these cases, the danger of fretting corrosion exists, and application factors must be applied, governed by judgment and experience.

► Static Capacity

The life formula is very useful for ordinary speeds and loads. However, it should not be used indiscriminately. For very low values of L_n , or when the bearing is at rest, factors other than fatigue life demand primary consideration. These factors are permanent deformation of the stressed surfaces or the danger of fracture of the load-carrying bearing components. The limiting load that a bearing can carry at rest without excessive permanent deformation is called the "basic static capacity" or briefly, "static capacity."

In most commercial bearings, the approximate ratio between the values of basic static capacity and specific dynamic capacity varies from 1:2 for the smaller bearing sizes (10 mm bore or less), to 1:1 for large sizes (100 mm bore approximate) with 1.25:1 for very large sizes (200 mm bore and larger). These ratios do not apply to pure thrust bearings, which have a basic static capacity considerably larger than the dynamic capacity.

In applications where the bearing is used only intermittently and at low speeds, it is safe practice to assume $L_n = 1$ million revolutions and the

load ratio, $C/P = 1.0$. However, in some special cases when increased bearing friction and very short life are not objectionable, the load can be considerably increased above the value of C . Such instances demand special analysis, taking into account the race thickness, size of rolling elements, etc. In no case, however, should the applied load exceed four times the specific static capacity.

► Friction and Limiting Speeds

Despite the often-used expression "antifriction bearings," some friction is always present in ball and roller bearings. This friction is due to sliding between the cage and the rolling elements, viscosity of the lubricant, possible inaccuracies in the ground raceways, and rolling friction.

So far, it has been impossible to calculate exactly the values of the frictional torque. Also, the frictional coefficient may vary considerably with load, speed and lubrication. For normal operating conditions and favorable lubrication, the values for the friction coefficient (based on experience) given in Table 4, can be used in rough calculations.

The friction coefficients in Table 4 refer to the bearing bore and do not apply to freshly installed bearings, which have higher friction. Also, the friction of external or built-in seals should not be neglected, since it is often considerably higher than the bearing friction. The bearing frictional torque can be calculated by

$$T = \mu P \left(\frac{B}{2} \right) \quad (4)$$

Bearing friction causes an increase in temperature. At very high speeds, this temperature rise may exceed the permissible limit. At high speeds, the design and material of the cage and the bear-

ing tolerances play an important part.

Very often, the "dN-number" of a bearing type is used to indicate the maximum permissible speed. This number is the product of the bearing bore in millimeters and the maximum speed in revolutions per minute. According to this formula, for example, a dN-number of 200,000 means that a bearing with a 50-mm bore diam would have a maximum permissible speed of 4000 rpm. However, this rule does not take into account the different bearing series—extra light, light, medium, and heavy. For identical bore diameters, various series have different outside diameters and different pitch-line diameters of the rolling elements. The rubbing velocity between cage and balls is higher for a ball bearing in the medium series than for one in the extra-light series with the same bore diameter, turning at the same rpm. Therefore, the maximum permissible speeds cannot be the same if other conditions are equal.

The bearing mean diameter, $D_m = (B + D)/2$, is a better denominator to determine the limiting speed. It takes into account the differences between bearing series, and closely approaches the pitch-line diameter of the balls or rollers for most bearing types. Approximate maximum speeds for commonly used bearing types are given, Fig. 3. Whenever an application requires speeds approaching or exceeding the indicated limits, the manufacturer should be consulted for special recommendations.

► Bearing Series

Most ball and roller-bearing types are made to standardized dimensions and tolerances of bore, outside diameter, and width. These dimensions are, in most cases, expressed in millimeters and con-

form to international standards. Some manufacturers supply inch-series ball bearings in addition to those in millimeter dimensions. Needle bearings and tapered-roller bearings, however, are furnished mostly in inch dimensions. Bore diameter of the bearing is indicated by the last two digits of the bearing number. These digits are sometimes called the basic bearing number or SAE bearing number. A bearing bore of 10 mm is indicated by the digits 00, 12 mm by 01, 15 mm by 02, and 17 mm by 03. For 20-mm bores and larger, the bore diameter in millimeters is five times the basic bearing number. For example, if the last two digits of a particular bearing number are 12, the bore diameter is 60 mm.

For each standard bore size, ball and roller-bearing types are made in different series, or proportions, of width and outside diameter, Fig. 4. These are known as extra light, light, medium, and heavy series. Table 5 lists the standardized external dimensions for all four of the ball and roller-bearing series. Some popular bearing types are furnished in one, two, three, or all four of these series.

Extra-light series, as the name implies, have the smallest outside diameter for a given standard bore size. This series is suitable for applications where large shaft diameters are desired for added rigidity, but where the housing diameter has to be kept within certain limits. This is often the case with relatively long or overhanging shafts, where the load is applied at a considerable distance from the bearing. In many such cases, deflection is the important consideration. The extra-light series is also often used on hollow and tubular shafts, where large bore sizes are required as compared

External Dimensions for Ball and Roller Bearings

Medium (300) Series				Heavy (400) Series				SAE Bearing Number

to the load carried.

Light-series bearings are widely used for normal and moderately heavy loads, and are usually the first choice for average bearing applications.

Medium-series bearings provide 30 to 40 per cent larger capacity than the light-series bearings of the same bore size. They are used for relatively heavy loads and applications requiring very long bearing life. These bearings are proportionately wider and of larger outside diameter than the light series and require more housing space.

Heavy-series bearings have a still larger cross section than the medium-series bearings. The added capacity of these bearings is seldom commensurate with the extra cost and space requirements. Also, specially proportioned shafts are required. For these reasons, heavy-series bearings are less used than other series, and are manufactured only in a few types and bore sizes.

Tips and Techniques

Estimating Distribution

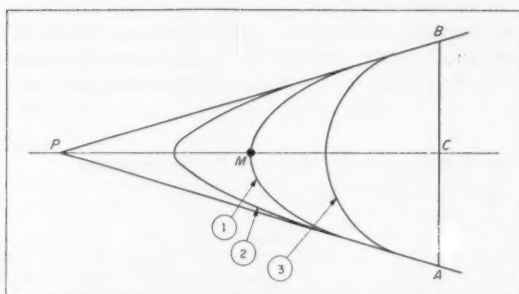

In analyzing plotted data, a triangle is a convenient tool to determine a "line of best fit" if a straight line has been marked on the underside.

If the data are consistently compared against a known distribution, lines indicating limits of distribution or standard deviations can also be placed next to the centerline.—ROBERT L. EBERHARDT, *Todd Shipyards Corp., Los Angeles Div., San Pedro, Calif.*

Which Conic Section?

Given a portion of a conic section, it is a simple matter to determine whether the section is a parabola, hyperbola or ellipse.

1. Draw any chord, AB , across the given section
2. Draw tangents to the curve at A and B to meet at P
3. Find the midpoint, C , of AB and draw CP to the intersection of the tangents
4. Find midpoint, M , of PC
5. A parabola will cross PC at the midpoint, M ; (curve 1)
6. A hyperbola will cut line PM ; (curve 2)
7. An ellipse will cut line MC ; (curve 3)

Crawler-Tractor Type Grippers Pull Paper-Covered Wire

DUAL GRIPPING "BELTS" are used to pull out paper-insulated, high-voltage paper in a machine designed by the Syncro Machine Co., Perth Amboy, N. J. The multiple-tread belts made of neoprene protect the cable from damage or excessive bending. Length of traction contact between the cable and threads is 42 in. A pulling force of about 4000 lb can be produced. Neoprene treads of various densities are used depending on the type of cable being run.

AUTOMATIC WRAPPING of cable diameters from $\frac{1}{4}$ to $3\frac{1}{2}$ in. is accomplished by the machine's 64 taping heads. This particular paper insulating machine is installed at the John A. Roebling's Sons Corp., Trenton, N. J.

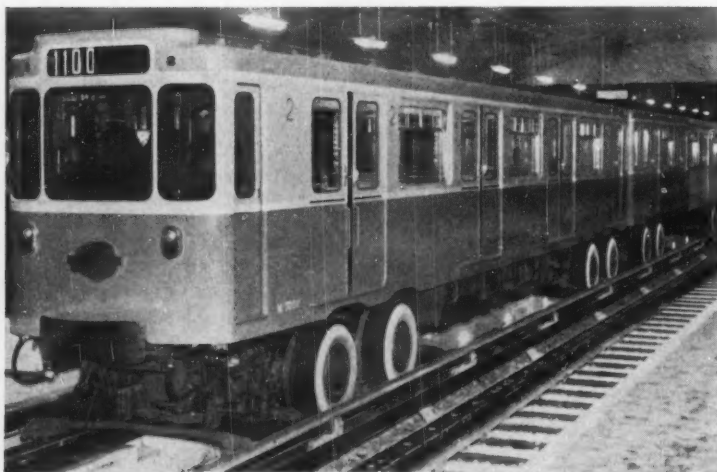

Rubber-Tired Subway Train

REDUCED NOISE AND VIBRATION are provided in a new electric subway train that runs on, and is guided by, pneumatic rubber tires. Used on trains on 14 lines oper-

ated by the Paris Subway and Surface Public Transport Authority, each train truck is designed with a total of eight rubber tires and four lightweight steel wheels.

Data and photos, courtesy Nelson Stud Welding Div., Gregory Industries Inc.

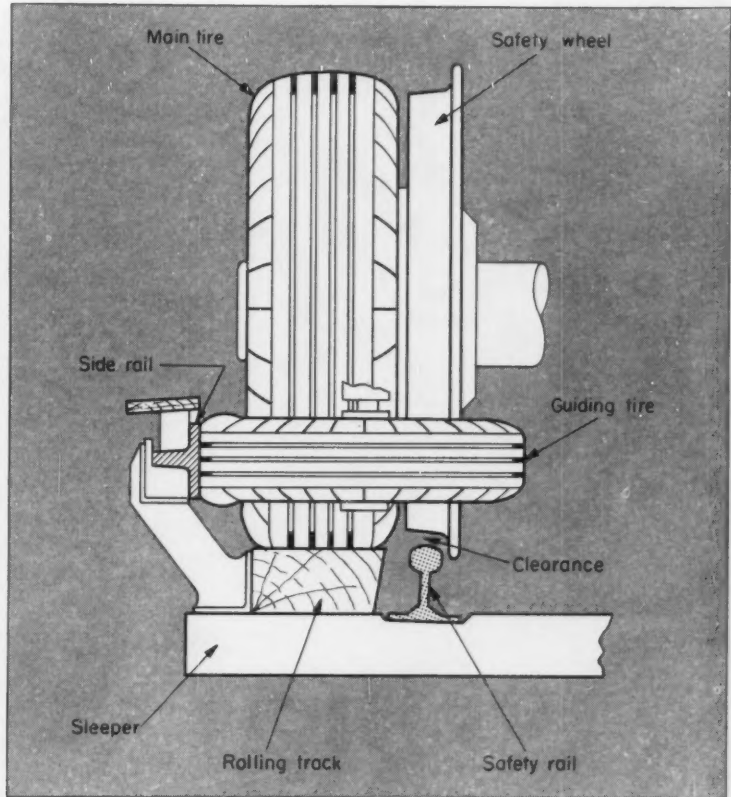

PASSENGER RIDING COMFORT and flexibility of operation are the main design advantages of this pneumatic-tired train set. Elasticity of the pneumatic tires and their good adhesion to the track permit following the surface of the streets closely in spite of heavy slopes.

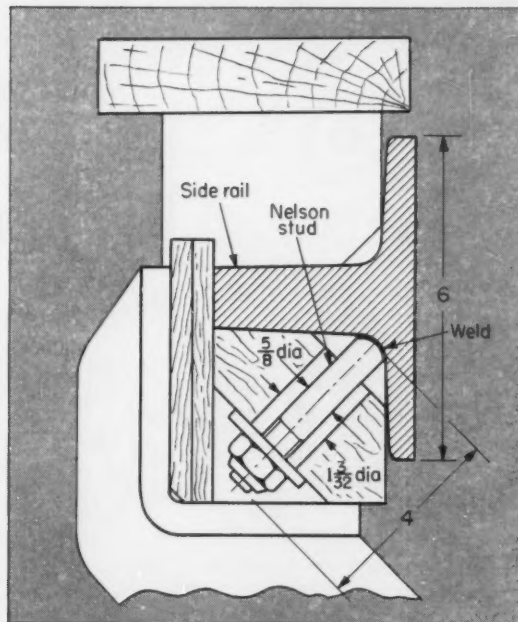

Designed to Run on Wooden Tracks

GUIDING ACTION for the trucks is provided by four pneumatic-tired horizontal wheels mounted on each truck. These wheels bear against T-shaped steel side rails. The four main tires on each truck roll on a wooden track made of red ironwood.

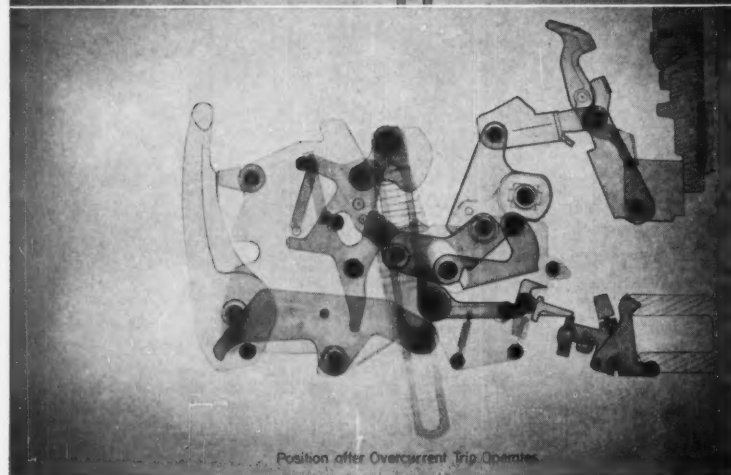

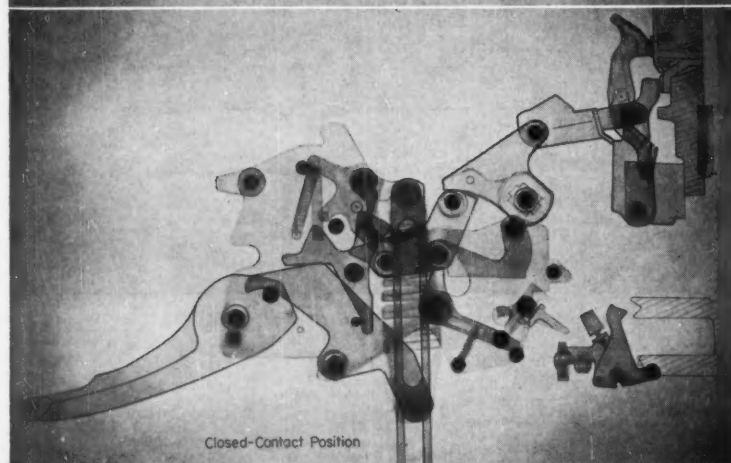

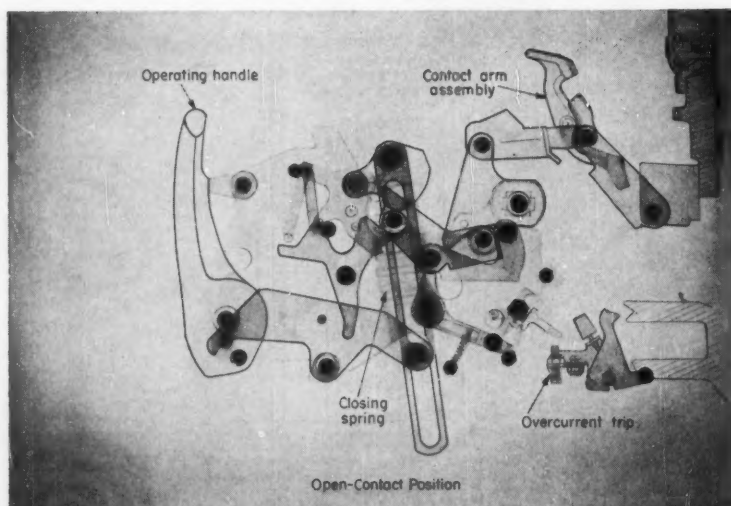

The steel safety wheels play a triple role in the design. First, they ensure guiding of the car at places where side rails are interrupted, such as at switches and crossings. Second, they roll on the rail and provide support in the event of a tire blowout. Third, they act as the drums for external brakes.

WELDED NELSON STUDS, fastened at a 45-deg angle, secure the T-shaped guide rails upon the insulating blocks. This mounting technique eliminates the need for both horizontal and vertical studs.

Springs in Manual Circuit Breaker

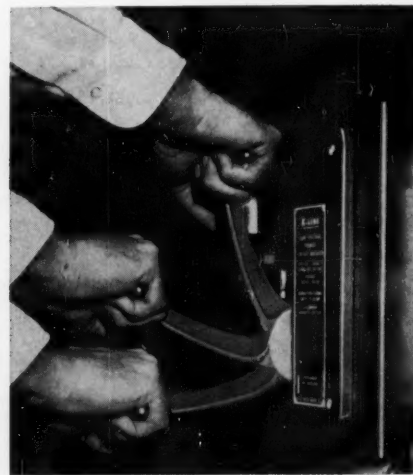

SNAP-ACTION CLOSING

mechanism used in circuit-breaker design doesn't depend on the operator to provide proper contact-closing speed. The closing mechanism, which minimizes contact arcing, is incorporated in a new line of low-voltage, power-type circuit breakers developed by Switchgear Div., I-T-E Circuit Breaker Co. The spring-loaded unit is designed for manual or motor operation. It latches the breaker in a closed position and allows the breaker to trip when required.

PULL-DOWN HANDLE

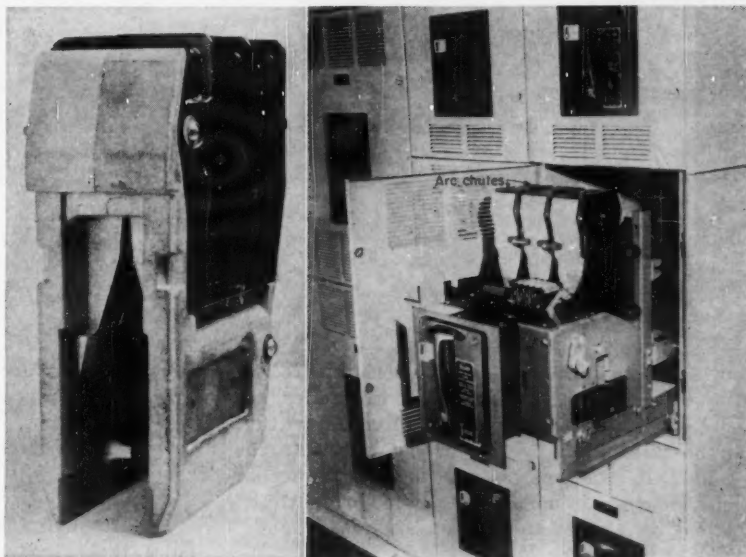

moved through first 90 per cent of travel extends a pair of helical springs in the closing mechanism. During the last 10 per cent of handle travel, the spring energy is released to close the contacts quickly and forcefully. After the operator lets go of the handle, it returns to its original position.

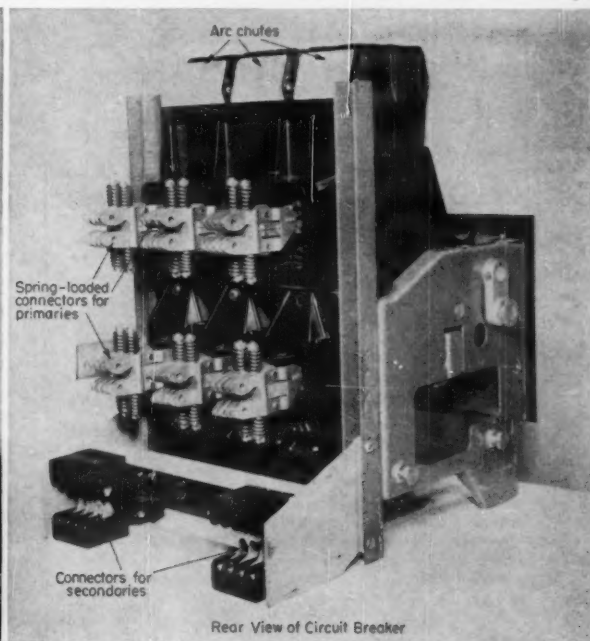

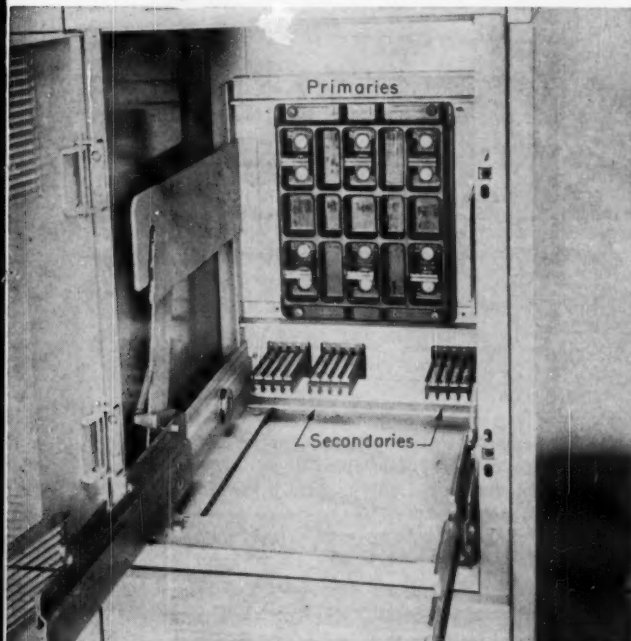

Automatically Control Closing Speed

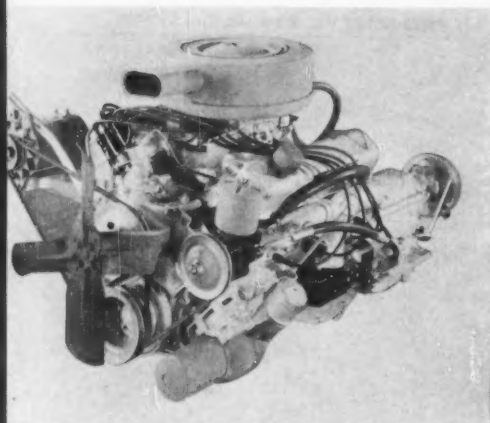

ARC FOLDBACK DESIGN used in circuit breaker cuts height of arc chute in half. The arc is directed upward, as in conventional designs, then back down by a baffle structure surrounding the top and sides of chute. The arc finally exhausts at sides from bottom of dark-colored baffle. Construction consists of asbestos-compound body, metal cooling plates and baffling made of a glass-polyester plastic composition.

TELESCOPING TWO-STAGE track, in extended position, shows point where breakers can be removed by direct lift. The track is part of a cradle assembly which simplifies breaker change when increased capacity is needed. Breaker slides from compartment on a rail-and-wheel design setup.

SPRING-LOADED FINGERS in rear of breaker tightly grip primary blades in the main current-carrying primaries. The parallel-finger arrangement provides blow-on action. Each finger pair is held by a separate spring which is outside of the current path. Secondary connectors, also of blow-on design, for control circuits, are mounted at base of breaker well below main current-carrying contacts. Up to 32 secondary connectors can be provided.

Mechanics of Vehicles—13

By JAROSLAV J. TABOREK*

Development Engineer
Towmotor Corp.
Cleveland

BASIC limitations to vehicle performance, reviewed in Parts 9 and 10 of this series, are set by the maximum tractive force that can be transferred by the driving wheels to the ground. In the analysis of these performance limits, it was assumed that torque supplied by the engine always equaled or exceeded the demands of the driving wheels.

In this article, the first of two that will be presented treating the subject of vehicle performance prediction, general characteristics desired of a

*Now Research and Development Engineer, Phillips Petroleum Co., Bartlesville, Okla.

vehicle powerplant are introduced, and methods for correcting standard data to existing atmospheric conditions are reviewed. Also surveyed are the power losses in accessories and drive-system components.

Vehicle Powerplants: Performance characteristics that ideally suit a powerplant for vehicle propulsion are: 1. Constant power output throughout the usable speed range. 2. Torque that peaks in the low-speed range where traction demands for grade climbing and acceleration are high. Plotted against engine speed, the characteristic curves of such a powerplant have the form of a straight line for power output P and a hyperbola for the torque M , Fig. 68. The equation of the torque characteristic has the general form

$$M = \frac{5252 P}{n}$$

Automotive powerplants in actual use have characteristics differing more or less from these ideal

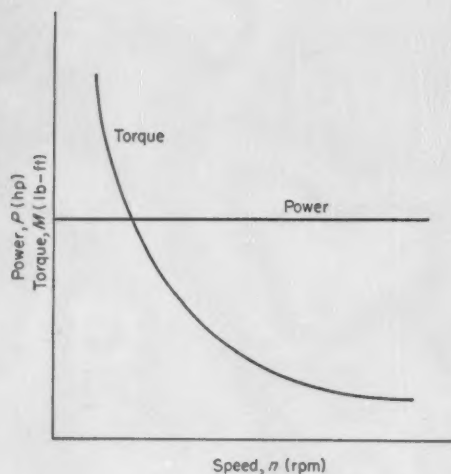

Fig. 68—Powerplant characteristics ideally suited for vehicle propulsion show constant power output over the entire speed range. This gives a hyperbolic torque curve and provides high tractive forces for vehicle acceleration at low road speeds.

Nomenclature

B	= Barometric pressure, in. Hg
B_o	= SAE standard barometric pressure (=29.92 in. Hg)
B_v	= Vapor pressure of air, in. Hg
c	= Number of cylinders
D	= Cylinder bore, in.
M	= Engine torque, lb-ft
n	= Speed, rpm
P	= Power delivered at output shaft, hp
p_b	= Brake mean effective pressure, psi
Q	= Volume output of pump, gpm
s	= Piston stroke, in.
T	= Absolute temperature, °R
T_o	= SAE standard air temperature (=520°R)
x	= Revolutions per power stroke ($x = 2$ for four-stroke cycle)
η	= Efficiency

Powerplant Characteristics

- propulsion requirements
- standard performance data

- transmission characteristics

requirements. In following sections, the internal-combustion engine, which powers the majority of automotive vehicles is discussed in detail; other powerplant types are reviewed briefly for comparison.

STEAM ENGINES: The steam engine, which as a rule develops peak power output at very low speeds, has characteristics that come close to satisfying requirements of the ideal automotive powerplant, Fig. 69. Such an engine would eliminate the need for a speed-change transmission and could be directly coupled to the vehicle driving axle. Despite these excellent qualities, use of the steam engine is generally limited to railroad applications, and seldom is it seen on automotive vehicles. One reason for this is the time required to put the steam engine into operation; a second disadvantage is poor power-to-weight ratio. Both these qualities are of decisive importance in road vehicles.

ELECTRIC MOTORS: The series-wound electric motor also has power-torque characteristics which approach the ideal for vehicle propulsion. There are two applications where electric powerplants are used in vehicles:

1. In battery-operated vehicles, mostly of the industrial type, requiring high tractive forces at very low speeds. These are conditions for which the electric motor is best suited. The power source is a storage battery; capacity of the battery determines the operation time for which the vehicle is independent of its base. Use of battery-powered vehicles is limited to short-range applications where weight is not objectionable. Often, in fact, battery weight is an advantage, for example, in industrial tractors and lift trucks.

2. Trolley buses, which find use in city transportation systems, operate on alternating current supplied from an overhead wiring system. The excellent adaptability of the electric motor to high-torque acceleration demands makes it an ideal powerplant for bus service with characteristically

frequent stops. The superiority of the electric motor over internal-combustion engine power is still unsurpassed in this respect.

INTERNAL-COMBUSTION ENGINE: Of all the possible power sources for propelling automotive vehicles, the internal-combustion engine has the most unfavorable power-torque characteristics, and can be used only in conjunction with a torque multiplying transmission. This is because of the inherent property of the engine to develop power in proportion to speed, giving torque-output characteristics unsuited for vehicle propulsion. Paradoxically, the internal combustion engine has nevertheless found the widest acceptance for automotive vehicles, due principally to its excellent

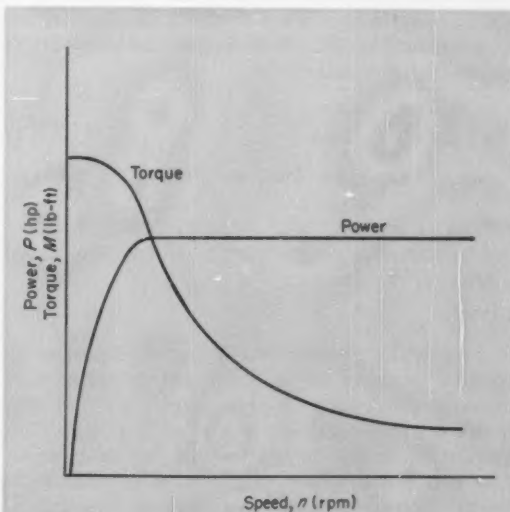

Fig. 69—Characteristics of the steam engine and the series-wound electric motor closely approximate the ideal for vehicle propulsion.

readiness for operation, high power-to-weight ratio, and wide availability of fuel.

Two different internal-combustion engine applications can be distinguished:

1. *Direct Drive:* In direct drive, which accounts for the majority of current applications, the engine is coupled through a transmission directly to the driving axle. The transmission can be mechanical (gear shift) or hydraulic (torque-converter type).

2. *Indirect Drive:* The internal combustion is merely the initial power source in the indirect-drive system; the actual driving is done by either electric or hydraulic systems.

The engine-electric drive combines the good operational properties of the combustion engine with the desirable power-torque characteristics of the electric motor. The relatively low efficiency of the combination, due to double transformation of power, is improved by running the engine at its economic optimum. Use of this type powerplant is limited at present to railroads and heavy duty industrial vehicle applications where advantages offered by the flexibility of the electric drive balance the increased cost and weight of the combination.

In the hydraulic-drive system, the engine drives a constant-displacement hydraulic pump which, in turn, supplies hydraulic fluid under pressure to a variable-displacement hydraulic motor coupled to the drive axle. Hydraulic-motor pressure and volume demands correspond to instantaneous driving conditions. Low efficiency of this combination is again justified by the excellent power-torque characteristics of the hydraulic-motor drive. The system is increasing in popularity for high-torque applications, where stepless speed regulation is essential.

Internal-Combustion Engine Characteristics: A typical power-torque diagram for a gasoline engine is shown in Fig. 70. Basic engine data are interrelated by the equation

$$P = \frac{p_b n D s c}{396,000 x} = \frac{M n}{5252} \quad (261)$$

Terms in Equation 261 are defined in Nomenclature.

From Equation 261, proportionality between brake mean effective pressure p_b and engine torque M can be derived as

$$M = k p_b \quad (262)$$

where k is the proportionality factor. Brake mean effective pressure is in itself not a measurable physical value, but is proportional to indicated pressure. Consequently, it is a function of a number of engine design factors and efficiencies. It is noted that power developed is a function of the product $p_b \times n$, while torque is proportional only to p_b .

The gasoline engine starts to run smoothly at a certain minimum or idle speed n_{min} and produces excess power at speeds above this point. Optimum combustion quality, and therefore maximum effec-

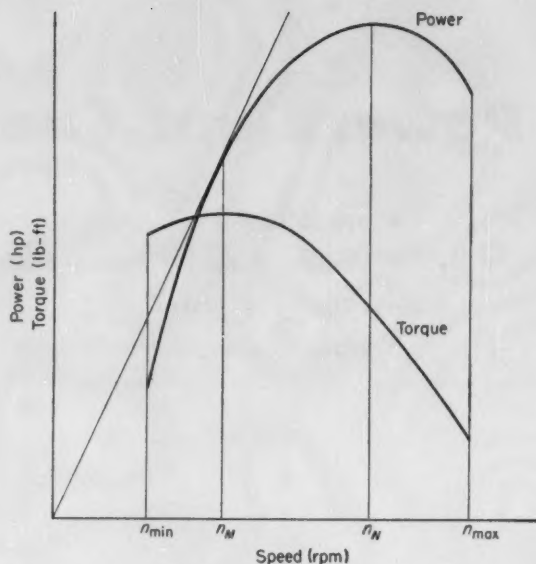

Fig. 70—Typical full-throttle characteristics of a gasoline engine. Maximum torque is given at speed n_M , which corresponds to the point of tangency of a line drawn from the origin to the power curve. Minimum speed, n_{min} , is engine idling speed; maximum torque is reached at relatively low power levels. Both of these characteristics account for the poor adaptability of the internal combustion engine for vehicle propulsion and point up the need for a change-gear transmission.

tive pressure, is reached at a medium engine speed where, as a result, maximum engine torque is developed. This point is designated in Fig. 70 as n_M . Power output at this rather low speed is also relatively low, which accounts for the poor adaptability of the combustion engine as a vehicle powerplant.

As speed increases further, brake mean effective pressure deteriorates due to the rapidly growing losses in the air-induction manifolds. Torque therefore starts to decline.

Power output is in nearly straight line proportion with speed up to the point of maximum torque. Beyond this point, the rate of power increase $\Delta P/\Delta n$ falls off until the maximum-power-output point is reached at n_N . The relative positions of n_N and n_M are often used as comparative measures of the quality and adaptability of an engine for given application.

Speed increase beyond n_N results in a fast decline in power output, determining therefore the position of maximum permissible speed n_{max} . In vehicle applications, this point is usually set just above the maximum-power-output speed. Vehicles designed for traction, however, are designed to operate at much lower engine speeds, since maximum torque and not power output determines performance limits.

The point of operation for maximum economy, corresponding to minimum specific fuel consump-

tion, coincides approximately with the speed of maximum torque. When transmission reduction ratios are properly selected, this economic optimum falls within the most frequently used part of the vehicle speed range. This is especially true for part-load operation, where differences in specific fuel consumption are particularly large.

Effects of Atmospheric Conditions: Maximum engine power developed is directly proportional to the weight of air inducted into the cylinder. Power output is therefore a function of the state of the air.

In gasoline engines, it is found that power is in direct proportion to barometric pressure (which changes with altitude) and approximately inversely proportional to the square root of absolute temperature. To permit comparison of engines on a basis that is independent of atmospheric conditions, performance data are measured experimentally on dynamometers and are recalculated to certain standard air conditions. These standards, which were established by SAE, are: 1. Temperature, $T_o = 520$ deg Rankine (60 F). 2. Barometric pressure, $B_o = 29.92$ in. Hg (dry air).

If engine power under standard air conditions is known, the effective power developed under any other set of conditions can be calculated from the equation:

$$P = \frac{P_o(B - B_v)}{B_o} \sqrt{\frac{T_o}{T}} \quad (263)$$

where P is effective engine power under the given atmospheric conditions (hp), P_o is engine power under SAE standard air conditions (hp), T is ambient temperature ($^{\circ}$ R), B is barometric pressure at the carburetor air inlet (in. Hg), and B_v is vapor pressure of the air (in. Hg).

The effect of air humidity, expressed in Equation 263 as vapor pressure B_v is, except under seasonally extreme conditions, usually negligible in performance calculations.

In Diesel engines, effects of atmospheric conditions on power output are more complicated, since not all the air inducted into the cylinders actually participates in the combustion process. Data-standardizing formulas are therefore functions of many variables that pertain to specific characteristics of a given engine, for example, engine size, quality of the fuel-air mixing process, etc. As a rough approximation, the following correction equation can be used for compression-ignition engines:

$$P = \frac{P_o(B - B_v)}{B_o} \left(\frac{T_o}{T} \right) \quad (264)$$

Atmospheric conditions can easily change engine output as much as 25 per cent. This is because air-intake temperature under the hood of an engine can rise to 200 F or higher, and air-intake pressures can be reduced substantially by increasing altitudes. Even daily variations at a given location can give a 10 per cent change in engine power.

The effects of air conditions and altitudes on engine power are graphically represented in Fig. 71. The plot allows the relative magnitude of these factors to be compared.

Engine Accessory Losses: Engine performance diagrams supplied to vehicle designers usually represent the power of the so-called "bare" engine. Since there is no generally accepted definition of this term, interpretation in each case should be carefully considered. This requires accurate knowledge of the conditions under which dynamometer measurements were actually taken in the laboratory.

Generally, the bare-engine performance diagram pertains to an engine stripped of all installations and accessories not essential to engine functioning and such accessories that are subject to in-

Fig. 71—Effects of carburetor-air intake conditions on internal-combustion engine power output. Normal power refers to engine rated power at SAE standard conditions (60 F and 29.92 in. Hg). Curve a shows power ratio vs. ambient pressure; curve b shows power ratio vs. intake temperature for gasoline engines; curve c shows power ratio vs. intake temperature for Diesel engines.

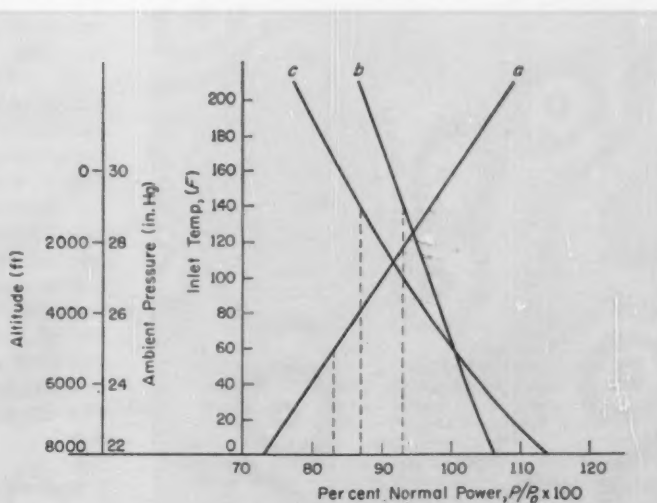

Example: Determine engine power ratio at 5000 ft altitude and 140 F air-intake temperature for gasoline and Diesel engines.

Gasoline engine:

$$P = 0.83 \times 0.93 P_o = 0.77 P_o$$

Diesel engine:

$$P = 0.83 \times 0.87 P_o = 0.72 P_o$$

dividual design and application requirements.

To obtain the power actually available at the output shaft, the power consumed by installations and accessories is subtracted from values given by the bare-engine power diagram. This gives a new diagram which represents the effective power available.

Installations and accessories found in the normal vehicle are reviewed in the following sections.

PUMPS AND DISTRIBUTOR: Water pump, fuel pump, oil pump and distributor drive form a special group since they are usually driven through internal connections from the engine block. As a rule, power requirements of these components are included in the bare-engine performance diagram. The fuel pump is sometimes an exception, since gravity feed may be used in the vehicle, making use of a fuel pump unnecessary.

MUFFLER: The muffler causes back pressure in the exhaust system and consequently power is lost in pushing through the burned gases. This power loss is proportional to the square of the engine speed and, depending on muffler resistance, reaches about 12 per cent at maximum power output. In high-performance engines, dual mufflers are used to reduce power losses to half of this value.

AIR CLEANER: Since the air cleaner is essentially a resistance element in the suction line, it causes a power loss proportional to the square of engine speed. Depending on its flow resistance, the average passenger-car air cleaner accounts for about a

3 per cent loss at maximum engine output.

GENERATOR: The generator has a varying power demand, depending on the instantaneous load in the electric circuit. At constant load, generator power-consumption characteristics have a linear relationship with speed. For the average passenger car, the generator requires about 2 hp at maximum engine power output.

FAN: Power requirement of the cooling fan is proportional to the third power of the speed and accounts for a considerable loss of power at high speeds. Shape of air-intake channels (grill) and operating speeds of the vehicle have an important effect on fan performance. On high speed vehicles, the natural flow of air often provides a substantial cooling effect. In fact, recent design developments have made it possible to automatically idle the fan when its function is not required, such as at high speeds and when starting a cold engine. On the other hand, vehicles working regularly at low speeds, or under intermittently stationary conditions, must depend entirely on the fan for cooling flow, since air flow due to vehicle speed is negligible. In rough approximation, an average passenger-car engine requires a fan with 1 hp power consumption at medium speeds. Power requirements increase about eight times when speed doubles.

HYDRAULIC PUMPS: Use of hydraulic pumps to provide power for auxiliary functions is increasing rapidly. On passenger cars fluid pressure is used for power steering, while hydraulically powered work-saving devices on agricultural and industrial vehicles are standard equipment.

The power consumption of a hydraulic pump can be calculated from the equation

$$P = \frac{Qp}{1714 \eta} \quad (265)$$

where Q is volume output (gpm), p is pressure (psi) and η is total pump efficiency, usually around 75 per cent. The power-consumption characteristic of a pump is basically in straight-line proportion with speed. At very high speeds, pump efficiency usually decreases, resulting in higher power consumption.

To determine how much of pump power should be subtracted from the bare-engine output, consideration must be given to the variation of pump-power demand with driving conditions. Power steering and other auxiliary equipment, for example, reach the peak power-consumption point when the vehicle is stationary and show reduced requirements at normal driving speeds.

Power requirement of all accessories should be carefully evaluated for each application and then plotted additively against engine speed. The final graphical summation is then subtracted from the bare-engine power diagram. The result represents effective power delivered to the transmission input shaft.

Transmission Characteristics: It has been shown in preceding sections that the internal-combustion engine is not in itself suited for vehicle propulsion,

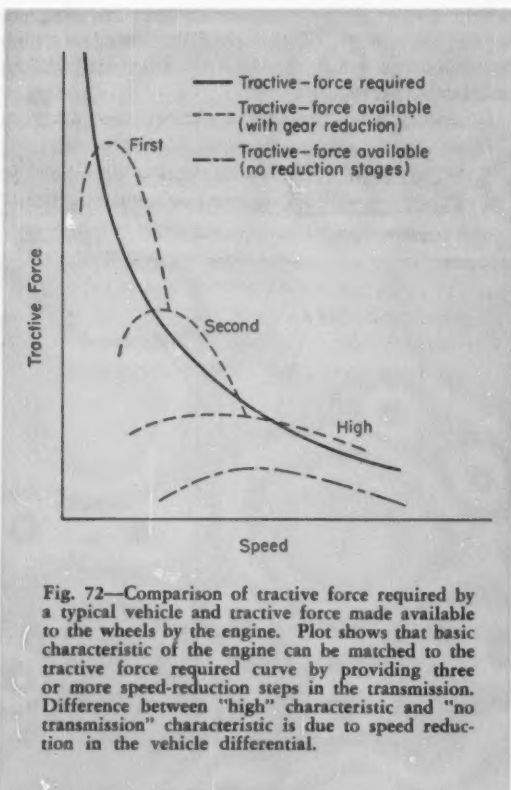

Fig. 72—Comparison of tractive force required by a typical vehicle and tractive force made available to the wheels by the engine. Plot shows that basic characteristic of the engine can be matched to the tractive force required curve by providing three or more speed-reduction steps in the transmission. Difference between "high" characteristic and "no transmission" characteristic is due to speed reduction in the vehicle differential.

since torque requirement for initial acceleration can be met only with the help of a change-gear transmission. The function of the transmission is to transform the torque-speed relationship of engine output into a form which more closely corresponds to actual driving demands, Fig. 72. This transformation is performed by the following means:

1. By the transmission itself, which can either have the form of a manual gear-shift transmission or that of a gear-reduction stage plus a hydraulic element such as a fluid coupling or a torque converter. Reduction ratios must be properly chosen in number and magnitude if the desired effect is to be obtained.

2. By a rear-axle gear, which gives, as a general rule, a constant reduction ratio of 3.5 to 6.5 through a hypoid gear pair. The rear-end ratio is determined by the usual practice requiring direct (non-reducing drive) drive through the transmission in high gear.

3. On vehicles requiring extremely high torques at low speeds, additional gear-reduction stages are usually placed at the drive wheels.

Power transmission between the engine output shaft and the driving wheels involves the following additional factors as power-consuming elements:

1. *Clutch efficiency*, amounting to about 99 per cent.

2. *Transmission power consumption*, originating in friction between gears and oil-churning losses. Gear friction is proportional to power transmitted and depends on gear-surface finish and quality of lubrication. Oil churning losses are proportional to approximately the third power of speed and are a function of oil viscosity. These factors result in an average transmission efficiency of 97 to 95 per cent for each gear pair, including final gear reductions. Torque-converter efficiencies,

which vary more widely with operating conditions, are discussed in the next part of this series.

3. *Efficiencies of bearings and joints*, assumed for a passenger car to be from 98 to 99 per cent.

4. *Wheel slip*. A driving wheel in one full turn makes a translatory advance which is less than the circumference of the circle corresponding to the rolling radius of the tire. The difference is explained by the slip of the driving wheels (Part 1) and depends mainly on the nature and condition of the ground surface. This effect is expressed as drive efficiency or slip factor, with values of approximately 95 to 98 per cent for normal highway surfaces.

Total efficiency of the drive system between engine output shaft and drive wheels is the product of all component efficiency factors. The following are representative average overall efficiencies for a vehicle with a change-gear transmission:

1. In direct gear, 90 per cent
2. In other gears, 85 per cent
3. Drives with very high reductions (final drive), 75 to 80 per cent.

Power loss in the transmission is manifested as heat in the gear-box oil, bearings and other parts engaged in power transmission. The heat is eventually transmitted to the outside air by convection and radiation.

In the next part of this series, two representative vehicles—a passenger car and an industrial truck—are matched to their powerplants and detailed calculations of resulting vehicle performance are illustrated.

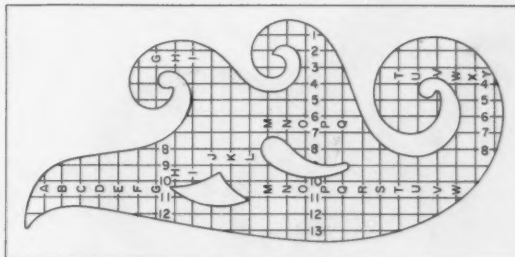

Mechanics of Vehicles

In "Braking Performance Limits," Part 12 of the series by Jaroslav J. Taborek, the example problem accompanying Fig. 64 was misplaced. It was intended to illustrate use of Fig. 67.

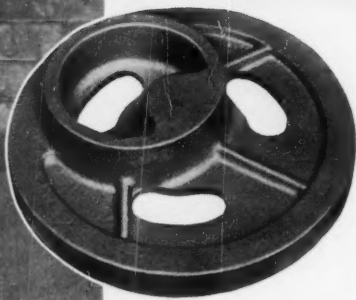

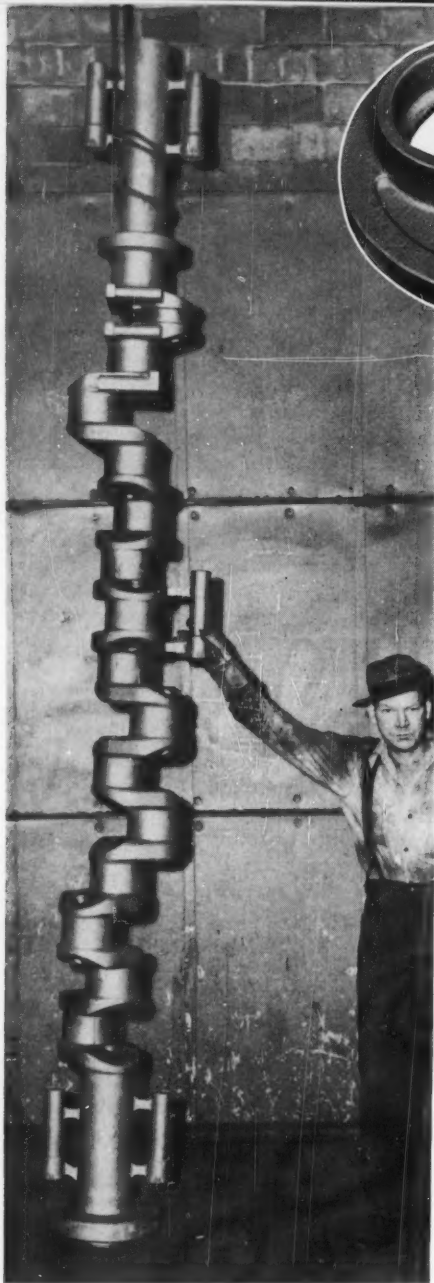

Tips and Techniques

French Curves

Symmetrical objects are frequently difficult to draw with French curves due to the problem of properly aligning the curve. Drawing the same curve a number of times presents the same problem. The curves can be adapted to perform such work by adding lines on one face of the curve. These lines provided reference points at their intersections to permit the curve to be repositioned in the same relationship to center or reference lines when drawing matching curves. These lines also provide divisions along the edge to permit the same section of the curve to be used each time. — CLINT McLAUGHLIN, Rockaway, N. Y.

Fatigue properties of

By **FRANZ R. BROTZEN** and

Rice Institute
Houston, Texas

Good strength, fatigue resistance, high damping capacity, and good wear resistance are some of the major properties of gray iron. Knowledge of these properties will enable the designer to select a type of gray iron suitable for applications where fatigue-inducing conditions occur.

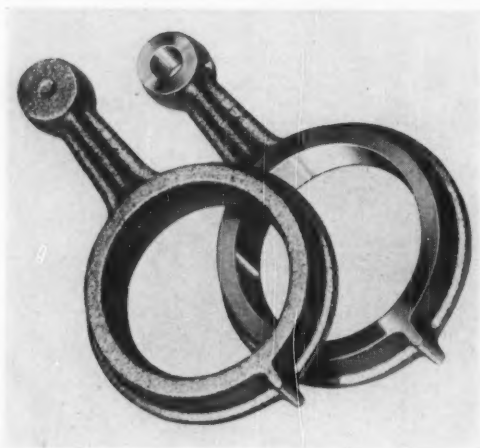

GRAY IRON exhibits excellent behavior in fatigue under a variety of conditions. It has extremely low notch sensitivity and is very serviceable for crankshafts and similar applications where fatigue considerations are important criteria of design. Ease of casting intricate shapes, facility of improving properties by heat treatment, excellent machinability, and relatively low cost provide the economic advantages of using gray iron. Fatigue properties of gray or unalloyed irons and low-alloy gray iron, generally with less than three per cent total alloy content, will be discussed in this article.*

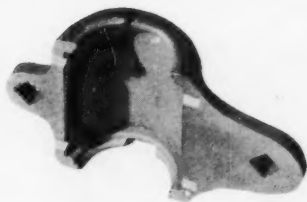

Endurance Limit and Endurance Ratio: The limiting stress sustained by a metal without fracture after a very large number of cycles of alternating stress (usually 10 million for ferrous materials) is the endurance limit in fatigue. Values for gray iron ranging from 12,000 to 32,000 psi have been reported for this limiting stress. Endurance limit generally increases with increasing Brinell hardness and compressive strength, although considerable scatter is observed.

*Based on "Properties of Gray Iron," from *Gray Iron Castings Handbook*, edited by Charles F. Walton, technical director, Gray Iron Founders' Society.

**Table 1—Endurance Limit and Ratios
for Various Gray Irons**

Type of Iron	Tensile Strength (psi)	Endurance Limit (psi)	Endurance Ratio
Pearlitic	41,000	19,000	0.46
	42,100	19,000	0.45
	48,600	21,300	0.44
	52,900	23,500	0.45
Acicular	63,900	24,600	0.39
	65,500	24,600	0.38
	65,900	25,800	0.39
	76,000	25,800	0.34

GRAY IRON

JOHN F. WALLACE

Case Institute of Technology
Cleveland, Ohio

The endurance ratio, obtained by dividing limiting fatigue stress by tensile strength, is widely used to compare fatigue behavior of metals. Endurance ratios between 0.33 and 0.60 have been reported for gray iron. This wide variation in endurance ratio is the result of the wide diversity of cast irons tested under different testing conditions. Endurance ratio is generally lower for higher strength irons, as demonstrated for several classes and types of gray iron¹ in Tables 1 and 2.

Influence of Stress Conditions: Values of endurance ratio and endurance limit must be used with caution because they do not depict behavior under various combinations of stress state or include effect of over-stressing or notches. Rupture strength in bending is greater than actual tensile strength because of different stress-strain characteristics of gray iron in tension and compression. Correspondingly, calculated endurance limit from bending fatigue tests can be as much as 25 per cent

above actual value. This variation actually depends on the type of iron and dimensions of the specimen. Endurance limit for axial loading has been shown by various investigators to vary between 59 and 94 per cent of the limiting fatigue stress for bending, but is frequently close to 75 per cent of limiting stress in bending.

The favorable strength of gray iron in compression and torsion results in excellent fatigue properties under these types of stress. Repeated loading in compression alone yields a relatively high endurance limit with an endurance ratio of 0.40 to 0.70. The endurance ratio for gray iron in torsion is generally about 0.40, although it is higher

Table 2—Endurance Limit in Bending for Different Classes of Gray Iron

Class	Endurance Limit (psi)	Class	Endurance Limit (psi)	Class	Endurance Limit (psi)
20...	about 10,000	35...	16,000-17,500	50...	24,500-27,500
25...	11,500	40...	17,500-19,500	60...	about 29,500
30...	13,700-15,500	45...	21,500-25,500	70...	about 31,500

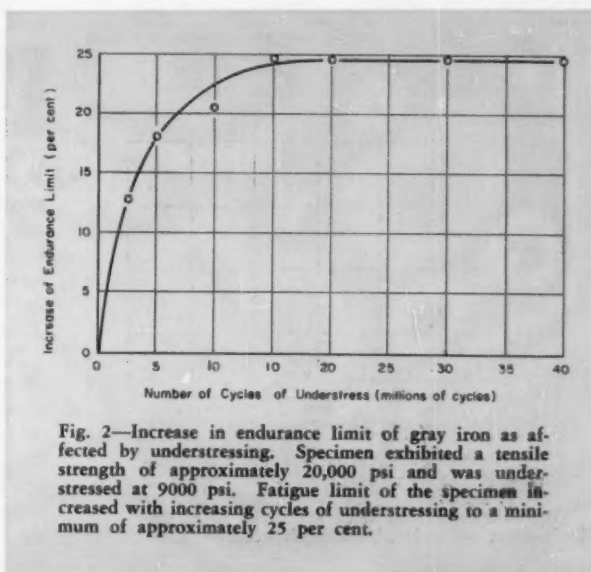

Fig. 2—Increase in endurance limit of gray iron as affected by understressing. Specimen exhibited a tensile strength of approximately 20,000 psi and was understressed at 9000 psi. Fatigue limit of the specimen increased with increasing cycles of understressing to a minimum of approximately 25 per cent.

for lower strength irons. The ratio of endurance limits in torsion to those in bending have been found to be as low as 0.75 and as high as 1.25.

Endurance ratio is usually higher when the load is applied from zero to a maximum in only one direction. In one study the endurance limit was found to be 19,000 psi for a complete reversal in bending, but 23,000 psi for bending from zero to

Table 3—Tensile and Fatigue Strength of Gray Irons

Gray Iron No.	1	2	3	4	5

*Containing 3.15 per cent carbon, 1.50 per cent silicon, alloyed with copper.

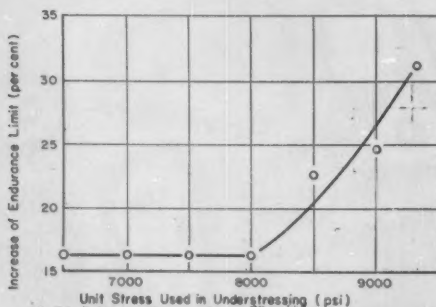

Fig. 3—Increase in endurance limit as influenced by the unit stress used in understressing a gray iron. Indications show that this increase in endurance limit does not occur to an important extent in high-strength irons.

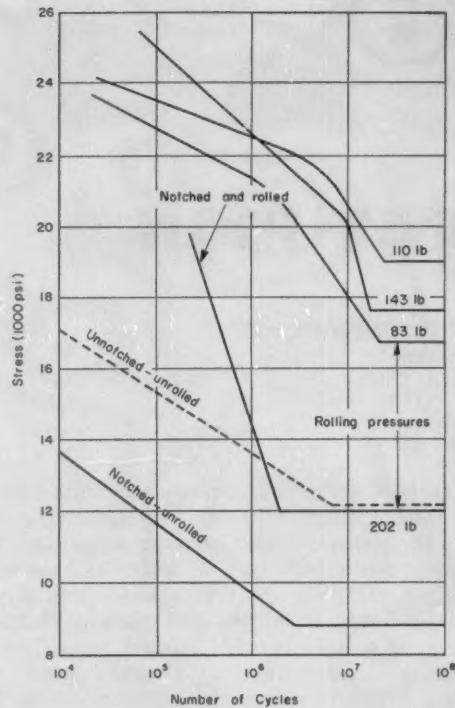

Fig. 4—Influence of rolling on fatigue strength of notched and unnotched test bars of gray iron with ferritic microstructure. Fatigue limit was improved 110 per cent by optimum pressure. Pressures above optimum result in surface damage and reduced endurance limit of the ferritic iron test bar.

a maximum. A similar increase was also noticed when fatigue testing was conducted in torsion. Limiting fatigue strength and endurance ratio of several high strength irons are shown for a variety of different fatigue loading conditions² in Table 3.

Notch Sensitivity: Introduction of stress raisers such as notches has little influence on fatigue properties of gray irons with tensile strengths of 40,000 psi or less. Notches reduce the strength of higher strength irons slightly. Notch sensitivity is generally measured by a fatigue stress reduction or *K* factor, which represents the ratio of the endurance limit of an unnotched fatigue specimen to a notched specimen. Effect of increasing tensile strength of the gray iron on the *K* factor is shown for several irons³ in Table 4. The average influence of notches on the endurance limit for tensile strengths up to 60,000 psi is also indicated graphically⁴ in Fig. 1.

It has been demonstrated in some work with crankshafts, for example, that relative dimensions of the gray iron part, in addition to influence of notches, can be changed to increase endurance limit. Stepped bars with different diameters show increased torsional fatigue limit compared to crankshaft sections. A reduction in all dimensions by 50 per cent increased limiting fatigue stress in torsion by 28 per cent for gray iron.

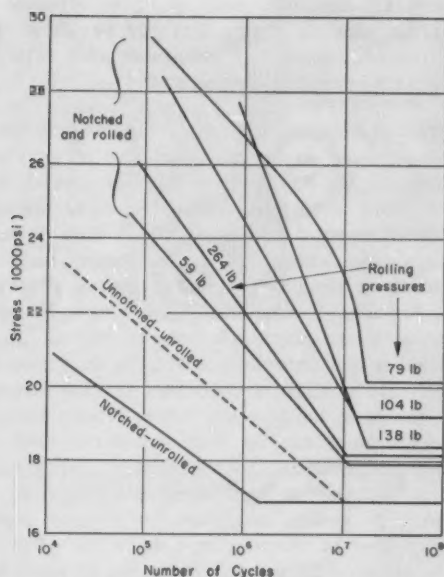

Fig. 5—Influence of rolling on fatigue strength of notched and unnotched test bars of gray iron with pearlitic microstructure. Endurance limit was improved 20 per cent by optimum pressure.

Overstressing and Understressing: When gray iron and other metals are subjected briefly to stresses above the endurance limit, the eventual limiting fatigue strength is usually reduced. Reduction in endurance limit by overstressing increases with stress and number of cycles. However, if the material is understressed by subjecting it to cycling or static stresses below the endurance limit, the resulting limiting fatigue strength is increased. Progressively increasing understress may improve endurance limit.

A study of the effect of overstressing on fatigue limit of gray iron at stresses up to 1.3 times the endurance limit has shown the excellent ability of cast iron to withstand overstress. Overstresses of 10 per cent for cycle ratios up to 80 per cent did not appreciably affect the fatigue limit of

unnotched specimens. For a $\frac{1}{4}$ -in. wide, 0.330-in. deep, square notch, overstressing actually improved the endurance limit of the iron. Only with a high degree of overstressing in the unnotched specimens did a significant decrease in fatigue limit occur. Ability to withstand overstress is somewhat less for high-strength irons.

The beneficial effect of understressing on fatigue properties can be demonstrated, although results are confined to low-strength irons. A gray iron with a tensile strength of approximately 20,000 psi and an endurance limit of 9300 psi was understressed at 9000 psi to obtain the increases in endurance limit⁵ shown in Fig. 2. Fatigue limit increased with increasing cycles of understressing to a maximum of 25 per cent. When this same iron was understressed for 20 million cycles at various stresses, the higher the understress employed, the greater the increase in fatigue limit obtained⁶ as shown in Fig. 3. There are indications, however, that this increase in endurance limit does not occur to an important extent in high-strength irons.

Effect of Surface Rolling and Surface Finish:

Fatigue properties of gray iron can be measurably improved by surface rolling. In some recent work performed with V-notched specimens of ferritic and pearlitic gray irons, the notch was rotated between hardened steel rollers. Various pressures were applied, thereby increasing tensile strength and inducing compressive stresses into the surface layers. Results indicate that an optimum rolling pressure exists for improving fatigue properties and that higher pressures damage the surface and reduce endurance limit. Fatigue limit of ferritic iron was improved 110 per cent by the optimum pressure,⁶ Fig. 4, while pearlitic gray iron showed a 20 per cent increase in endurance limit,⁶ Fig. 5. S-N curves for unnotched-unrolled and notched-unrolled metal are shown in both cases for comparison. It has been shown that fatigue strength of a cast crankshaft can be improved by cold rolling or roll polishing.

As might be expected from the low notch sensitivity of gray iron, its fatigue properties are

Table 6—Effect of Heat Treatment on Endurance Limit of Alloyed Gray Irons

little affected by surface finish. Dependence on surface condition was shown, however, when the fatigue limit of a high-strength iron was improved approximately 20 per cent by removing the cast surface layer by machining.

Effect of Structure, Composition, Section Size, and Heat Treatment: Fatigue properties of gray iron are very sensitive to structure, particularly graphite size and distribution. Endurance limit is usually considerably better in gray irons with fine graphite, and is even more affected by this constituent than is the tensile strength. Effect of original as-cast structure still influences endurance limit after heat treatment. When tensile strength is increased by alloy additions, endurance ratio (not necessarily endurance limit) is generally decreased as shown for copper additions^{7, 8, 9} in Table 5.

Fatigue properties are also influenced by heat treatment of gray iron castings,^{10, 11} Table 6. It has been demonstrated by quenching and tempering and by isothermal quenching that endurance limit does not increase as rapidly as the strength is increased. Thus, endurance ratio decreases and notch sensitivity increases as strength is increased by heat treatment.

High-tensile strength irons, such as those with an acicular structure, usually exhibit a lower endurance ratio, although some of these irons have been reported with endurance ratios as high as 0.46. The lower strength austenitic gray irons in the 29,000 to 35,000 psi tensile strength range generally exhibit an endurance ratio of slightly more than 0.50.

Increasing section size reduces fatigue strength

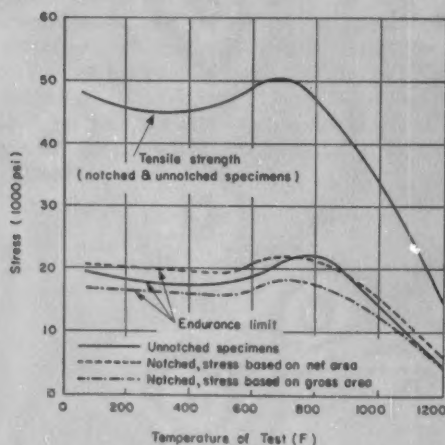

Fig. 6—Influence of elevated temperatures on tensile strength and endurance limit of a gray iron in notched and unnotched test specimens. Endurance limit decreases rapidly above 800 F. Austenitic gray irons, however, show acceptable fatigue life to 1160 F.

of gray iron just as it affects other mechanical properties. Available data on the influence of test-piece size on fatigue properties show that both the endurance limit and endurance ratio decrease with increasing section size.

Effect of Elevated and Low Temperatures: Effect of temperature on fatigue properties of gray iron is slight to 800 F. Some results for special, low-silicon irons even indicate that fatigue strength may be somewhat higher at 400 F than at room temperature. Above 800 F, endurance limit, as measured by bending fatigue specimens, decreases rapidly,¹² Fig. 6. Austenitic gray irons, however, demonstrate an acceptable fatigue life to 1160 F. A nickel-copper-chromium austenitic gray iron has shown only a slightly decreased fatigue strength from the room temperature value. Tensile strength decreases more rapidly than endurance limit for these irons, with the result that endurance ratios usually increase at high temperatures.

The only results available for fatigue testing of gray iron at temperatures down to -50 F indicate about a 25 per cent increase in endurance limit when the temperature is decreased from 80 to -50 F. Notch sensitivity of the gray iron was not altered by this decrease in temperature. While endurance limit might not improve as much with other irons over this temperature range, it does appear that low-temperature fatigue properties are at least equivalent to those at room temperature.

Forced-Air Cooled Refrigerator

The condensers in the 1958 Westinghouse refrigerator line are made of wire and tubing, not the refrigerated plates as stated on Pages 144 and 145 of the November 14, 1957, issue of MACHINE DESIGN. The refrigerated plates are made of a preformed sheet-and-tube design.

The Personal Side of Engineering

By **EDWIN C. NEVIS**

Personnel Research and Development Corp., Cleveland, Ohio

Applying Your Creative Potential

A WIDELY held assumption, particularly among scientific and technical people, is that the main factor in solving a technical problem is training, intelligence, and technical know-how. And in thinking about creativity or looking for people to solve difficult problems, we think of those who possess a high level of intellectual ability.

Intellectual level of an individual is important, particularly for complex, abstract problems. But a great many personality and temperament factors are also related to the ability to solve problems, as well as to the way a problem is conceived and the way in which a solution is undertaken. In describing the approach of the competent, capable worker, we tend to use such adjectives as "persistent," "curious," "absorbed in what he is doing," "flexible," and so on. Yet these terms refer more to the *quality* of a person's intelligence rather than to his sheer capacity. The implication is that a man's potential is applied in a way which is characteristic of his general view of life and of himself.

The way we organize our problem-solving depends upon the kind of person we are, the experiences we have undergone in our life, and the values which we stress as being important. If we are theoretical-minded, we will emphasize the discovery of truth in our approach to a problem. If we have a high need for social acceptance, we may be more likely to emphasize the use to which our results are put and the acceptance we can win from other people for solving the problem. If we are power-oriented, our approach to the problem may emphasize the status and prestige we can achieve in return for our solution. And each of these emphases will lead us to a somewhat different approach to the problem, though at all times our intellectual power may be in use.

Not only do deeply engrained, life-long values influence our approach to problems, but also day-

to-day fluctuations in our feelings and our attitudes toward our job, the people who work with us, and those under whom we work. It is not uncommon to find an engineer or scientist who appears to be momentarily stopped in his solution to a problem, but who moves quickly ahead after he has resolved some supposedly unrelated personal problem or conflict.

Some clear-cut patterns in problem-solving stand out. For example, certain individuals see each problem as a tremendous challenge and a stimulus to move into action immediately. These action-oriented people do not give long, intense analytical treatment to a problem, but rather make a quick survey of what is required and act fast. Such individuals tend to show up well in emergency situations where the kind of solution is not necessarily as important as the speed with which the problem is attacked.

A highly theoretical person, however, may sit back and, at a bit of distance, attempt to form an abstract conception of the problem. Such individuals are particularly adroit at planning and organizing an approach to problems. At times, they do not give as much attention as might be desired to gathering empirical facts, but their solutions are generally well-organized, coherent, and frequently sophisticated.

Then, there is the person who sees each problem in relation to other problems and searches for the opportunity to perform on a broad basis. Such individuals generally have a good deal of intellectual initiative and enterprise and are frequently valuable in defining problems to be attacked—sometimes more so than in actually solving them.

Another type is the individual who is extremely good at gathering specific facts and making careful observations and plans. This carefully detailed approach can often serve the needs of more theoretically inclined individuals, who may be more able to do the broad, basic planning for research

and design projects. These few examples barely indicate the range of possible problem-solving approaches.

Individual differences or "styles of performance" must be taken into consideration in practical situations. Appreciation of the quality of a person's intellectual approach can be helpful in assigning tasks which utilize his particular style fully. Thus, we might have two equally bright people in terms of basic intellectual capacity. But one might be better at taking quick action on specific, limited projects, and the other more capable of long-range, abstract planning.

Appreciation of these factors can also help us understand the viewpoints of other people, and

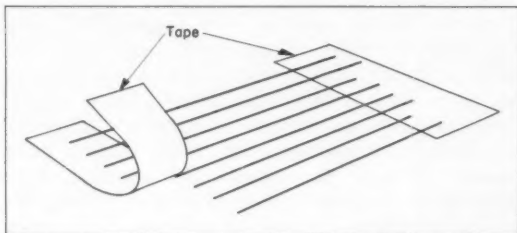

particularly, help us realize why people with intelligence and experience do not always solve problems presumably within their grasp. Finally, appreciation of these differences tells us that it is somewhat improper to think of people only as being more or less intelligent. We need to think of ability in terms of qualitative, as well as quantitative, differences.

For these same reasons, it may be best to consider problem-solving as an art, and to think of the scientific method as a tool in the service of the "artist." Since they are engaged for the most part in applied problem-solving, engineers might try to evaluate the intangible and emotional factors in their own and their colleagues' problem-solving behavior. This analysis can foster greater mutual understanding and enhance productivity.

Tips and Techniques

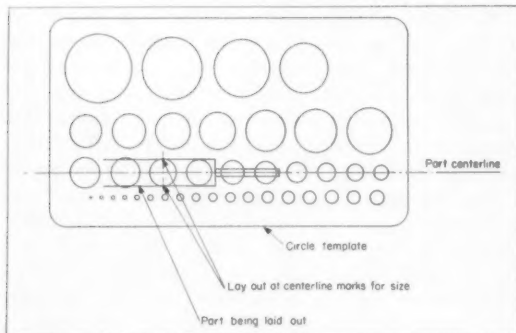

Lines of Equal Length

When ruling many close parallel lines, as for tables on a drawing, strips of masking tape will help assure equal lengths. Two strips of tape are placed perpendicular to the direction of the lines,

spaced to mark the ends of the lines. The tapes speed drawing by eliminating the exact starting and stopping points. When the tapes are stripped, the ends of the lines are all even and sharp.—JOHN G. STEFFEY, W. H. Reisner Mfg. Co. Inc., Hagerstown, Md.

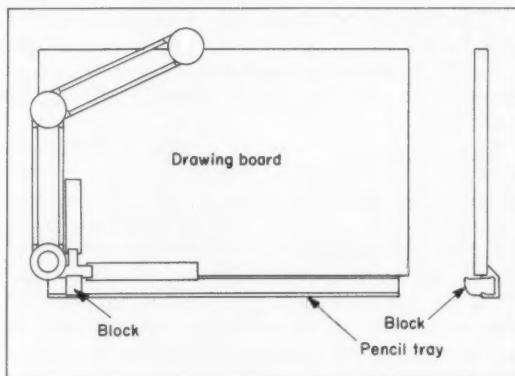

Symmetrical Parts

Much time can be saved by using a circle template, in place of a scale, for laying out or drawing small parts which are symmetrical about a centerline, such as bolt heads, shafts, etc. The centerline of the part is lined up and the tangent points (90 deg) are marked. This technique is especially helpful on small parts, where dividing 1/16s on a scale is awkward.—PAUL S. PETERSEN, General Mills Inc., Mechanical Div., Minneapolis, Minn.

Drafting-Machine Block

Unless a drafting machine is counterbalanced, it will slide off a board tilted at a steep angle. To prevent this occurrence, a 2-in. wide block can be

made to fit the pencil tray of the drawing board. The block must be high enough to catch the scale. When the machine is not in use, it can be set against the block.—ROBERT WEBB, Oshkosh, Wis.

Design Guide for **STAMPED GEARS**

By **FEDERICO STRASSER**
Santiago, Chile

INEXPENSIVE, lightweight gears for light to medium-duty applications can be designed for stamping from sheet metal. When gears are produced partially or entirely by stamping, tooling costs may be greater than when made by other methods, but if the quantities are large, final costs can be very low. Depending upon production requirements, justifiable tooling costs, and precision of tooth-form required, gears can be stamped complete including the teeth, or the gear blanks can be stamped and the teeth produced by conventional gear-cutting methods.

Stamped gearing offers the designer a number of advantages which are important in lightweight, low-cost gear trains:

1. Shapes are almost unlimited, providing conventional press-tooling can produce them. Tabs, stops, nontoothed portions, holes, extrusions,

and bosses are readily incorporated in one-piece designs without necessity of extensive machining or assembly of small parts.

2. Sizes are relatively unlimited within the range of practical gearing requirements for the thicknesses available. One major supplier lists a range of thicknesses from 0.006 to 0.250-in. and a pitch-diameter range from 3/16 to 10 in.
3. Tolerances are good. As stamped, gear teeth can be readily produced to within 0.002-in. of required tooth profile. While expensive tooling is required, stamped teeth can be die shaved to within 0.0005-in. of desired profile. Stamped gearing can be held to within ASME Commercial Class 4 requirements. Typical pitches for stamped gears are 8 to 120. Naturally, when stamped blanks are machined with conventional gear-cutting methods, similar tolerances are secured as with any other type of blank.
4. Weight is a decided advantage. Sheet-metal

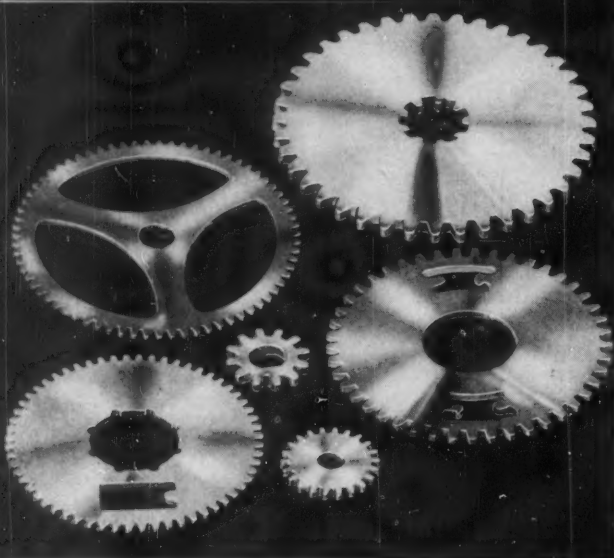

Fig. 1—Stamped flat gears may be designed to include lightening cutouts, spring pockets and similar details. Courtesy Winzeler Mfg. and Tool Co.

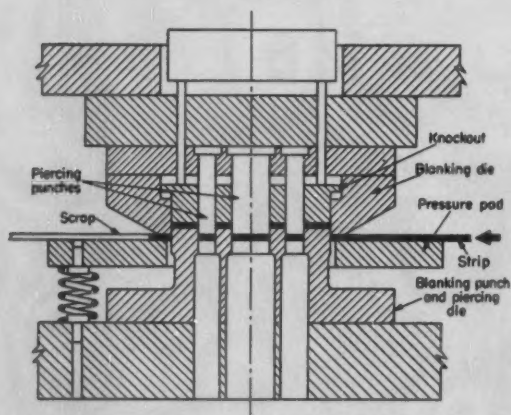

Fig. 2—Compound dies pierce the center hole, blank the exterior, and pierce other required openings simultaneously. Concentricity depends only upon the precision with which the die is made, and is normally very close.

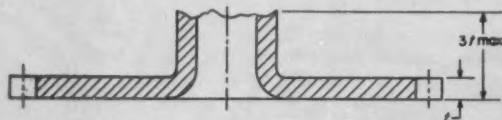

Fig. 3—Light hubs may be formed by extruding the center hole. The ID can be held to very close tolerances, but the end of the extrusion will be ragged and no precise height can be held.

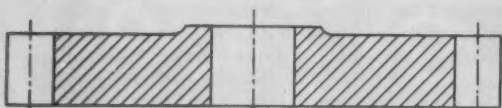

Fig. 4—Swaging, a kind of cold forging, may be used to produce raised hubs or to force the teeth into a female die for good finish and precision.

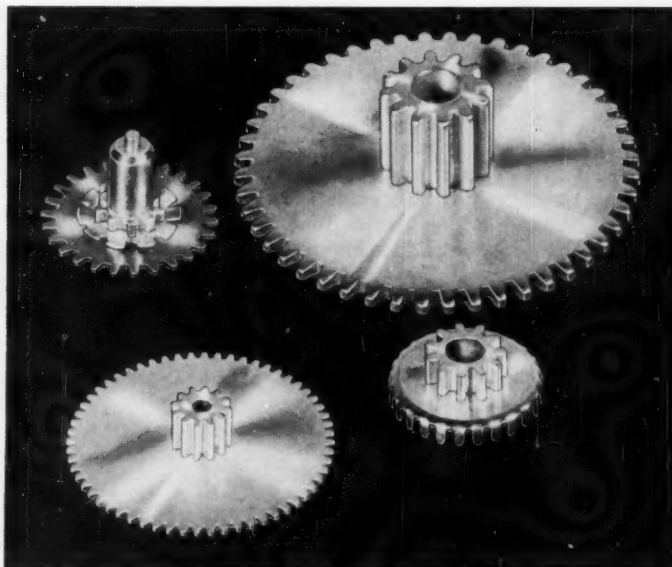

gears are inherently lightweight. By piercing lightening holes, this advantage can be increased.

5. Surface smoothness depends on the finish of the original sheet material. Normally very good, this finish can be whatever is required.
6. Material choice is wide, including all of the ferrous and nonferrous metals which are normally adaptable to the stamping process.
7. Production, in pieces per man-hour of direct labor or per machine-hour, can be very high. This is a function of the type of tooling and machine used to produce the part. For high-volume stampings, the direct labor is virtually negligible when production is run with progressive dies on automatic presses.
8. Finishing costs are low and the selection of finishes is very broad. If dies are maintained in good condition, little or no deburring is required. The selection of coatings and platings available is the same as for other sheet-metal products.

Naturally, stamping of gears has its disadvantages. Presses are expensive, and hourly machine costs may be higher than for other production methods. Tooling costs are high, and can be very high. Little or no design changes can be made without constructing entirely new tooling. Tooling lead time, compared with other gear-production methods, is adverse. Except for temporary or short-run tooling, the die design, tryout and development may take months. However, certain specialty firms offer standardized gears from their own tooling. When a design permits their use, these gears can be employed without waiting for tooling to be built and without high tooling costs for short runs.

Flat Gears: Sheet-metal gears can be produced

Fig. 5—Stamped gears can be assembled to separate hubs, pinions or shafts by staking, brazing and other methods. Courtesy Winzeler Mfg. and Tool Co.

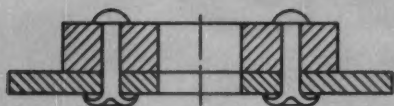

Fig. 6—Riveting is a common way of joining composite gears. However, to assure concentricity between bore and pitch diameter of teeth, a subsequent chucking and reaming operation is normally needed.

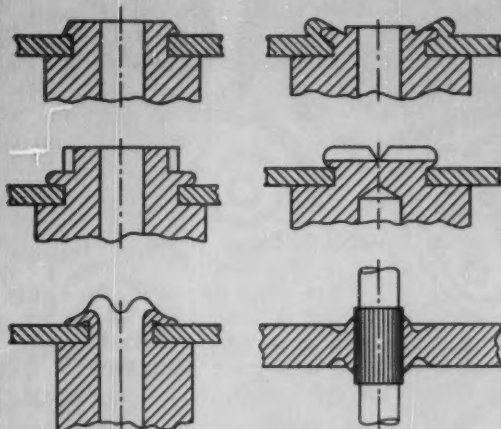

Fig. 7—Staking is widely used for joining gear assemblies and offers good concentricity.

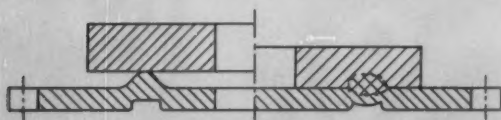

Fig. 8—Resistance welding produces a low-cost assembly but requires reaming the bore for good concentricity.

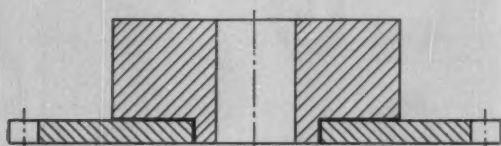

Fig. 9—Soldering or brazing offers good concentricity after assembly. Most nonferrous composite gears are joined in this way.

with any kind of holes, cutouts or irregular profiles or nontoothed portions desired, Fig. 1. Backlash-spring windows, commonly employed in instrument gears, are produced without additional operations. Thickness of the gear is limited to the tooth width at the pitch line in most cases, so a definite relationship exists between the pitch and the maximum material thickness.

Flat gears or gear blanks may be produced on a number of different types of press tooling, de-

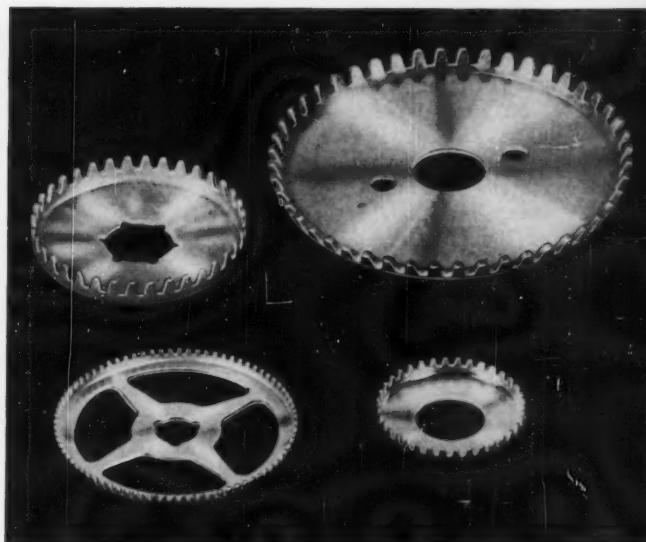

Fig. 10—Crown gears afford an inexpensive method of changing plane of rotation and simplify many design problems. Courtesy Winzeler Mfg. and Tool Co.

pending primarily upon production requirements. Progressive dies are usually the most costly and offer the highest hourly production. However, compound dies, Fig. 2, are normally employed for stampings where concentricity between a center hole and the outside diameter is important. Compound dies, like progressive dies, produce a complete part for each press stroke. The primary difference is that on a compound die, the entire inside and outside contour is done at one time, while in a progressive die, internal holes are normally pierced first and the outside shape is blanked last. This progression of operations means that concentricity depends upon piloting from station to station within the die.

Typical flat gears are found in low-cost gear trains in nonprecision instruments, clock works, toys, etc. The possible size range is wide enough to fulfill almost any requirement. Pitch diameters may range up to 10 in. and material thickness up to $\frac{1}{4}$ -in.

Gears with Hubs: Flat gears can be provided with extruded bores, or the hub may be a separate part. Extruded bores, Fig. 3, are limited to about three times the material thickness, depending upon bore diameter and material. If the required hub height is less than material thickness, the raised hub can be swaged, Fig. 4. For swaging, the gear is normally produced from material slightly thicker than the final desired tooth width and the excess material is cold forged to form the embossed hub.

Composite construction, Fig. 5, can join a stamped gear to a hub, shaft, pinion, or other part. Any of a number of joining methods may be employed, including mechanical fasteners, stak-

ing, welding, soldering and brazing. For very low power requirements, press-fit joints are occasionally used, although these usually need staking or some other locking means if nonrotation of the gear in relation to the hub is desired.

Mechanical fasteners are usually rivets, Fig. 6, unless the gear is designed so that it may be readily removed from its hub; in this case, threaded fasteners should be used. Staking, Fig. 7, takes many variations, although in each case the gear or the hub, usually the latter, is deformed in a die to lock the two units together. Arc welding is

reserved for larger assemblies, but projection welding, Fig. 8, is widely employed. Nonferrous gear assemblies are usually soldered or brazed, Fig. 9.

Crown Gears: When two mating gears are not in the same plane, stamped gears can be designed to serve the same purpose as bevel or face gears in conventional gear design, Fig. 10. Such gears are produced by cupping or flanging the edge of the blank, including the gear teeth. These gears are normally produced by first stamping a flat blank with a special developed tooth shape. After crowning, the tooth shape is standard form. Normal angles of crowning are 60 and 90 degrees.

A variation of drawing can be used for internal gear designs. The gear, Fig. 11, is made in two pieces, one piece for the internal gear and the other for the back. The two may be joined by brazing, staking or the other normal joining methods.

Gears can be designed for heavy loads where the necessary material thickness is too great for the desired pitch by using laminated construction, Fig. 12. Any desired face width may be specified by increasing the number of laminations. Exact alignment of the teeth is provided by half extrusions, dimples, or holes and dowel pins, Fig. 13. The laminations are permanently joined by employing rivets, welding or brazing.

Stamped Gear Teeth: Press operations alone can produce gear teeth to ASME commercial Class 4 limits, Table 1, with shaving. Shaving operations

Table 1—ASME Commercial Gears, Class 4

Specification	Tolerance, TIR (in.)
Center distance composite error, total....	0.0015
Composite error, tooth to tooth	0.0007
Backlash in mating gears	0.004 to 0.006
Runout, OD with bore, DP 20 to 39	0.003
DP 40 to 79	0.002
DP 80 and finer	0.001

Table 2—Typical Die Clearance

Material	Per Side (per cent of <i>t</i>)
Aluminum alloys 1100 and 5052	4.5
Aluminum alloys 2024 and 6061	6.0
Brass, all tempers	6.0
Cold-rolled steel, dead soft	6.0
Stainless steel, soft	6.0
Cold-rolled steel, half hard	7.5
Stainless steel, half and full hard	7.5

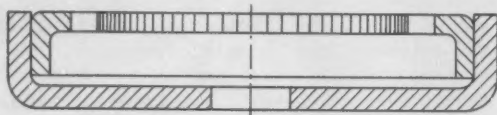

Fig. 11—Above—Internal gears may be designed for stamping. The gear is made in two parts, the internal gear itself, and a separate back. A variety of joining methods may be employed.

Fig. 12—Below—Gears for heavier loads may be designed by laminating two or more to obtain the desired face width. Courtesy Winzeler Mfg. and Tool Co.

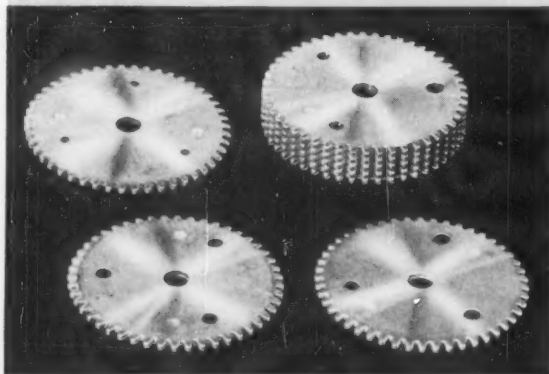

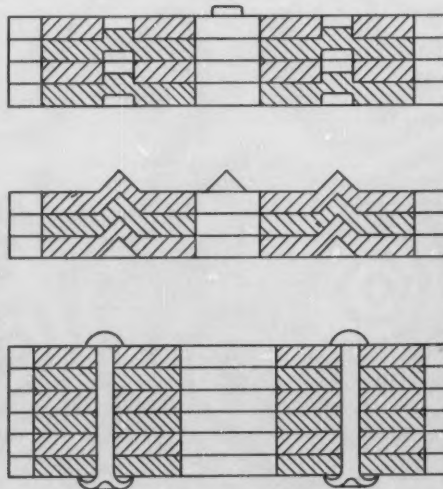

Fig. 13—Below—In laminated construction, half extrusions, dimples or dowel pins assure tooth alignment. Joining is usually by rivets, welding or brazing.

produce much closer tolerances than stamping alone, with finishes to 64 microinches rms, but the tooling is expensive. It must be remembered that although the size and shape of a stamped tooth form will change very little throughout the life of the die, the sheared edge of a stamping is neither smooth nor square, Fig. 14. If the dies are maintained in good condition, about $\frac{1}{3}$ to $\frac{1}{2}$ of the material thickness will be the exact size of the female die opening. This surface will be quite smooth; the rest of the surface will be rough and tapered to the size of the male punch. Since punch and die clearance for steel averages 7 per cent of material thickness per side, each individual tooth thickness will vary about 15 per cent of the material thickness, side to side of the tooth face at the pitch line. Table 2 gives representative die clearances for various materials. If these dimensional variations do not fulfill design requirements, the teeth can be die shaved to provide about 90 per cent smooth face, or the gear can be stamped as a blank and the teeth machined in afterward. Conventional gear-machining methods are then used, such as hobbing, shaper-generating, milling, broaching, etc.

Swaging will produce nearly full-face gears to extremely close tolerances, but the tooling is expensive and subject to rapid wearing. Swaging is most useful when design configurations are required that can not be economically produced by other methods. These configurations can include

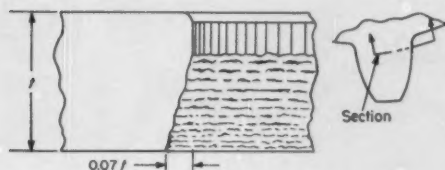

Fig. 14—Stamping does not produce a smooth tooth face. The sheared edge is to size and fairly smooth for approximately $\frac{1}{3} t$, then tapers back with a somewhat ragged surface. This surface condition can be corrected by shaving, but the shaving die is expensive.

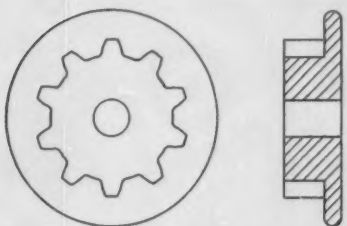

Fig. 15—Swaging, although requiring expensive tooling, can be used to produce unusual design requirements. Swaging, a type of cold forging, can be used to force a part into a die cavity for high precision and good finish, or to produce features such as the half shroud shown.

hubs, as mentioned before, local thickening at the rim, shrouding on one side of the teeth, etc., Fig. 15.

Stamped gears should be considered whenever low-cost or lightweight gears are required for high-volume applications. Tooth faces are neither regular nor high precision, but if volume justifies the tooling, tooth forms can be produced to tolerances comparable with cut teeth.

This article is based partially on data made available through the co-operation of the Winzeler Manufacturing and Tool Co., Chicago, Ill.

Tips and Techniques

Resistance Calculations

The resistance equivalent to that of two resistors in parallel, or of two capacitors in series, is given by

$$\frac{1}{R_t} = \frac{1}{R_a} + \frac{1}{R_b}$$

where R_t = equivalent resistance of the network; and R_a and R_b are individual resistances.

This law of combination holds for a number of other quantities also. The equation is usually written in the form

$$R_t = \frac{R_a R_b}{R_a + R_b}$$

An alternative form can be obtained by dividing both numerator and denominator by R_b (assuming $R_b > R_a$). Then,

$$R_t = \frac{R_a}{1 + R_a/R_b}$$

Thus, R_t is always less than R_a (the lower-valued resistor) and the amount by which it is less can be easily estimated from the ratio R_a/R_b . This form also lends itself to simple slide-rule calculations. If R_b on the C scale is set opposite R_a on the D scale, R_a/R_b (a quantity between 0 and 1) appears under the C-scale index. The C-scale index is then moved to this value plus one, on the D scale. Then, over R_a on the D scale, R_t is read from the C scale.

In similar fashion, one can determine the resistance R_b that must parallel R_a to obtain a given R_t from the expression

$$R_b = \frac{R_t}{1 - R_t/R_a}$$

This adapts itself for both quick estimation and for simple slide-rule calculation.—JESSE E. ROTH JR., electrical engineer, Otis Elevator Co., Electronic Div., Brooklyn, N. Y.

A one-man helicopter, the Hiller XROE-1 Rotorcycle, utilizes a number of strategically located single-acting quick-release pins to achieve complete "foldability." Progressive stages in the assembly of this unique design are shown in Fig. b through f. A close-up view of some of the assembly details appears in Fig. g. Developed for the Marines, this small helicopter weighs 270 lb; is powered by a Nelson two-cycle, four-cylinder, horizontally opposed, air-cooled engine rated at 40 bhp/4000 rpm. It has a maximum speed of 70 mph and a working range of about 170 miles. The complete assembly folds into a compact package that can be easily transported from point to point or air dropped to personnel.

Fasteners

Part 2—Quick-Release Attachment

- Basic Forms
- Selection Factors
- Design Practices
- Production Considerations

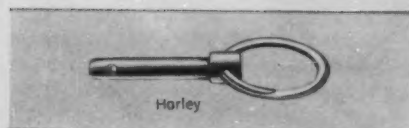

SIMILAR in form but different in details of construction and application, pin fasteners can be adapted to a wide range of assembly requirements where loading is primarily in shear. From a design standpoint, two specific fastening functions are offered by the various types of pin devices: 1. Semipermanent assembly. 2. Quick-release attachment.

Pin fasteners for semipermanent assembly were covered in detail in a previous article (November 14 issue, Pages 122-131). In this second article attention will be given to the various quick-release pin types and the factors influencing their selection and application in specific design situations.

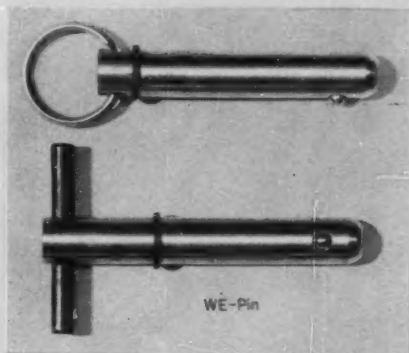

Several commercial pin devices have been developed for rapid, or frequent, manual assembly and disassembly. Except for one quick-release "cotter pin," these pin designs are based largely on aircraft requirements and have seen wide use in the assembly and installation of ground-handling and airborne equipment for both fixed and rotary-wing aircraft. However, applications in both industrial and domestic equipment are growing more common in a wide range of light and heavy-duty assembly functions.

Typical possibilities are graphically demonstrated in the accompanying illustrations of a "collapsible" helicopter design which utilizes a large number of quick-release pins to effect complete assembly or disassembly of the aircraft structure.

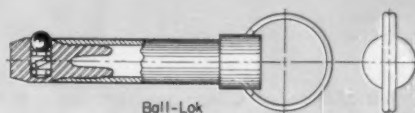

A self-contained fastening device, the quick-release pin represents the result of combining a standard pin form with some type of manually operated locking mechanism. Certain practical advantages in ease and convenience of assembly and

Fig. 10—Typical commercial quick-release pin designs of the push-pull type. Core of detent assembly may be either a spring, as shown in the cross-section view, or some other resilient means.

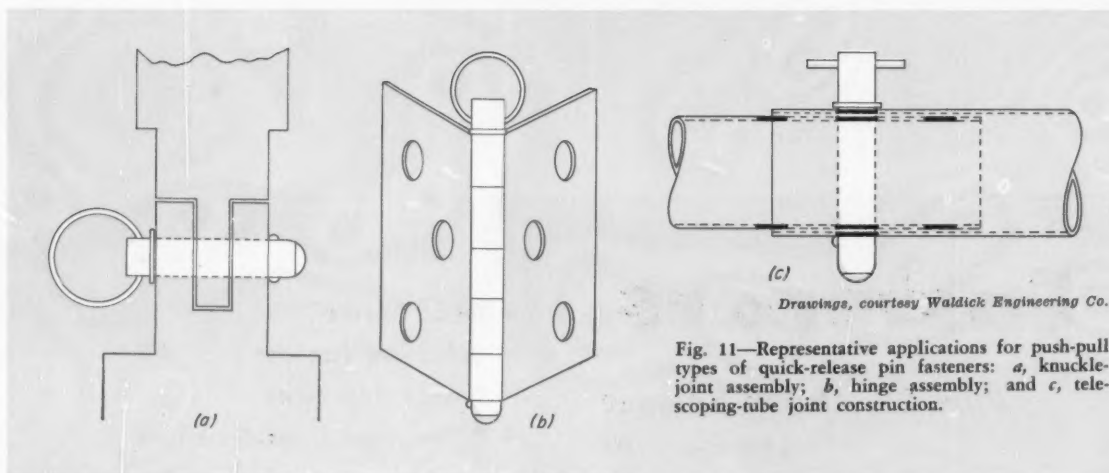

Fig. 11—Representative applications for push-pull types of quick-release pin fasteners: *a*, knuckle-joint assembly; *b*, hinge assembly; and *c*, telescoping-tube joint construction.

disassembly are achieved through the design, although unit costs of these pin devices will generally run higher than for other fasteners because of the more elaborate construction involved.

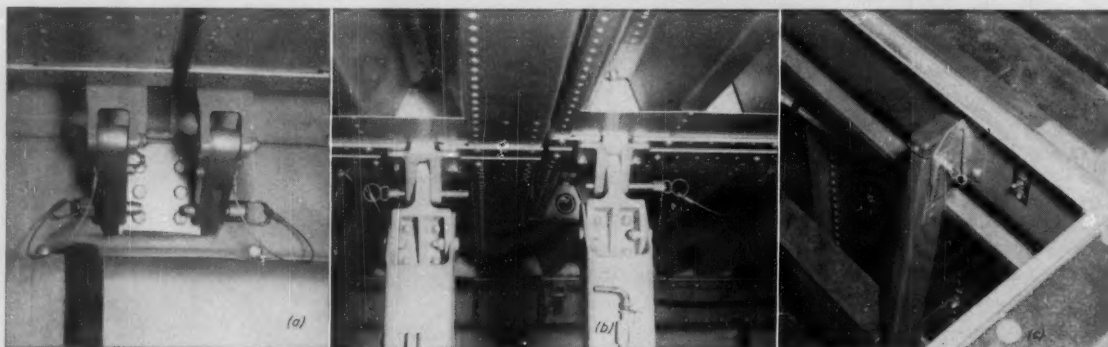

In contrast to the majority of semipermanent pin fasteners which require a "force-fit" assembly, quick-release pins are designed for a clearance fit in holes formed to nominal-diameter dimensions. Holes drilled to normal production tolerances are generally considered adequate; however, manufacturing and accuracy requirements may influence the degree of precision necessary.

Commercially available quick-release pins vary widely in head styles, types of locking and release mechanisms, and range of pin lengths. Unlike the semipermanent-assembly pins, these fasteners are not presently covered by any formal standards, although the possibilities of a standardization program are now being studied in the air-

craft industry. However, established manufacturing practices for the various commercial pin devices are generally considered adequate for design applications as related to pin tolerances and strength, and reliability of locking devices.

Quick-release pin fasteners are of two basic types: 1. Push-pull. 2. Positive locking. Pins of the first type employ a retaining mechanism that is actuated by manually overcoming resistance to insertion or removal. For the second type, operation of the locking mechanism is independently controlled. Each of these general types will be considered separately.

Push-Pull Pins: Representative quick-release pins of the push-pull type are shown in Fig. 10. These pins are made with either a solid or hollow shank, containing a detent assembly in the form of a locking lug, button, or ball backed up by

Photos, courtesy Aviation Developments Inc.

Installation of complete upper deck in Douglas C124 is accomplished with quick-release pin fasteners. Knuckle-joint arrangement, *a*, anchors half of floor structure to side of fuselage. Similar construction, *b*, holds center supports in place. These sup-

ports can be quickly removed, allowing each half of floor to drop against sides of fuselage to facilitate the cartage of "tall" equipment. Access to upper deck is provided by detachable metal-ladder assembly, *c*, that is anchored with quick-release pins.

Fig. 12—Heavy-duty, positive-locking, quick-release cotter pin. When the pin is inserted, the ring is folded down to lock the pin securely in position.

some type of resilient core or plug. The detent member projects from the surface of the pin body until sufficient force is applied in assembly or removal to cause it to retract against the spring action of the resilient core and release the pin for movement.

Common commercial pin sizes offer a range of nominal diameters from 3/16 to 1 1/4 in. (1/16-in. steps) in grip lengths from 1/2 to 4 in. (0.1-in. steps). Pin materials include standard screw-machine stock, Leadloy, and low-carbon, stainless, and heat-treated alloy steels. In addition, custom pins made to special size, material or shape requirements can be obtained from manufacturers.

These pins are normally supplied with a pulling ring mounted in the head section, although other grip designs, such as T and L-shaped handles, are available. Rated pull-out loads (force required to actuate detent) vary with manufacturers but can be regulated within limits to meet specific assembly requirements. Normal range is 10 to 30 lb, depending on pin size; however, ratings from 5 to 50 lb are possible. A value of about 10 lb is generally considered adequate for most design situations.

Typical applications for pins of the push-pull type are shown in Fig. 11. These pins are made 0.002 to 0.004-in. undersize to fit any standard hole drilled to nominal-diameter dimensions. From an operational viewpoint, holes up to 0.010-in. oversize are permissible; however, pull-out loads can be expected to decrease as looseness of fit increases. To facilitate assembly of the pin, hole edges should be deburred or slightly chamfered.

Primary function of these pins is to fasten parts under shear loading. Ideally, direction of load application should be at right angles to the shank of the pin. Locking mechanisms of these pins are designed to provide secure retention against accidental disassembly due to vibration or the force of pin weight. But they are not recommended for application under tension loading.

Shear strength of the pin is a function of the pin material. For pins of high-alloy steel, heat

treated to a tensile strength of 125,000 psi, load capacity in single shear varies from about 3700 lb for 1/4-in. size to about 59,000 lb for 1-in. size.

In the specification and application of push-pull types of quick-release pins in mechanical assemblies, here are some practical points to be kept in mind in design:

1. To prevent pins from being lost or mislaid, or from falling into the operating assembly and becoming lodged, some means of anchoring the pin near the point of application should be provided. For example, a short length of cable, chain or wire can be employed to fasten the pull grip or handle to a main structural member, allowing sufficient slack to permit free movement of the pin in assembly and disassembly.

2. If pin assemblies are to be exposed to severe environmental conditions (temperature, moisture, etc.), consideration should be given to the possibility of jamming due to freezing or expansion of the pin and its mating parts. In some instances, pretesting of prototype assemblies under simulated operating conditions may be justified where reliability is a critical factor.

3. In rotating assemblies, pull-out load developed by the pin should be sufficient to withstand the effect of any centrifugal forces produced. Otherwise, the pin may creep out of its hole, unlocking the assembly.

4. Location of the pin assembly should permit easy pin removal by a quick pulling motion with one hand. High pull-out load requirements in cramped space can lead to problems in assembly and disassembly, and should be avoided.

Positive-Locking Pins: Three types of quick-release pin fasteners have been developed in which the locking action is independent of insertion and removal forces. One is the heavy-duty cotter-pin design mentioned previously. The other two types are the various single-acting and double-acting pin devices.

As in the case of the push-pull pins, these pins are primarily suited for application under shear loading. However, some degree of tensional loading usually can be tolerated without affecting the pin function. As a general rule, construction of these pins is more elaborate than for the push-pull types.

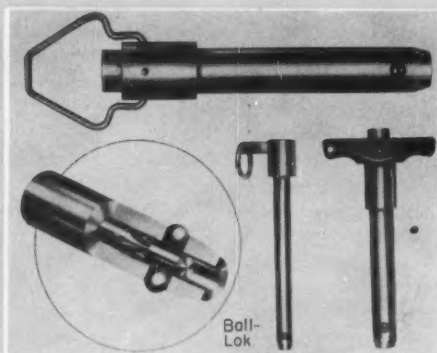

HEAVY-DUTY COTTER PIN: Developed for heavy-duty fastening service in agricultural equipment, this quick-release pin, Fig. 12, employs a forged high-carbon steel body to replace the conventional split-cotter construction. Locking action is provided by a tempered steel snap ring mounted to the head of the pin. In assembly the ring folds over the end of the shaft, or similar member, in which the pin is assembled.

Design options include round and semiround (flat on back side) pins. The round pin has a nominal diameter of 1/4 in. and a shank length of 1 3/4 in. Semiround pins, with a nominal diameter of 7/16-in., are available in shank lengths of 1-

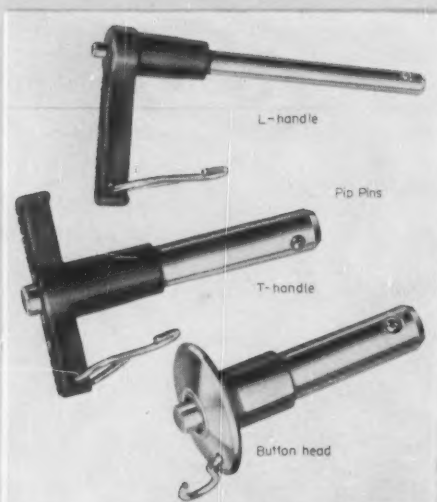

7/16 and 1 3/4 in. Two snap-ring sizes are furnished: 1 3/8 and 1 5/8 in. diameters. The snap rings are wound with a slight spiral to keep them firmly folded against the pin in the locked position. Pin assemblies can be obtained with a length of sash chain attached for anchoring to the machine structure.

Simple but rugged fastening elements, these pins have seen wide use in the attachment of tractor hitch assemblies. They have also been employed in door latches or as a means for anchoring pivoted or hinged machine members.

SINGLE-ACTING PINS: Representative types of single-acting pins are shown in Fig. 13. Similar in appearance, and in certain aspects of application, to the push-pull pins discussed previously, these quick-release fasteners are basically an aircraft development.

Photo, courtesy D. W. Price Corp.

Photo, courtesy Aviation Developments Inc.

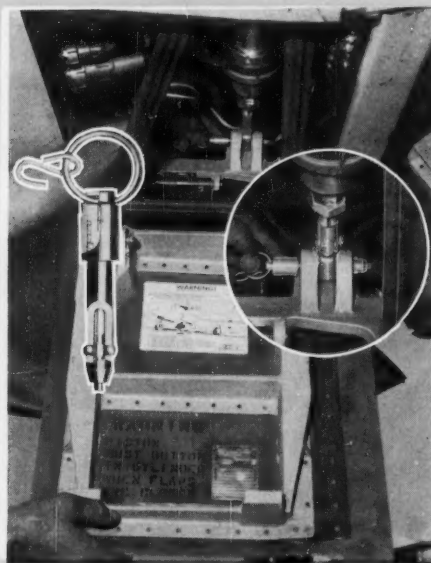

Fig. 13—Typical commercial designs of single-acting, quick-release pin fasteners. Locking action of pin is controlled by means of manually operated spring-located plunger-and-ball mechanism.

Locking action is controlled by a spring-located plunger-and-ball mechanism. In normal (locked) position, balls project beyond the surface of the pin shank to provide a positive lock. When the plunger is moved by means of a button or lever assembly at one end of the pin, the balls are free to sink below or flush with the pin surface, releasing the pin for movement in and out of the hole.

Commercial pin sizes include a range of nominal diameters from 1/4 to 1 in. (1/16-in. steps) in grip lengths from 0.1 in. up (1/8 or 0.1-in. steps). One manufacturer, for example, offers grip lengths up to 9.9 in. as standard.

A number of head styles and release mechanisms have been developed for these pins. Conventional forms include button-head, T-handle, and L-handle designs, Fig. 13, with a pushbutton release. The button-head construction is recommended for general-purpose application and offers advantages from an appearance standpoint. The T and L-handle designs are recommended where binding in assembly is possible and may require a firm grip and twisting motion for disassembly. Pull-release types, as well as combination push-pull units, for remote operation or other special assembly requirements can also be obtained.

All of these pins are made undersize (from 0.0015 to 0.0045 in. depending on manufacturer) for a free fit in holes drilled to nominal-diameter

Photos, courtesy Aviation Developments Inc.

Fig. 14—Conventional double-acting, quick-release pin fastener showing construction details and typical application in Lockheed T2V-1 dive-brake assembly. Used for direct connection of hydraulic actuator and dive-brake crank horn, pin provides positive locking action but can be readily driven in or out of fixture for quick removal and assembly under tactical operations.

dimensions. Potential applications parallel those of the push-pull pin devices, Fig. 11.

Minimum single-shear strength of these pins varies from about 4100 lb for the $\frac{1}{4}$ -in. size to 65,300 lb for the 1-in. size. These values are based on one-half of the average double-shear failure strength determined by test. As indicated previously, in addition to primary shear strength, these pins offer limited capacity in tension. Determining consideration in such applications will be either the strength in bearing of the part material in contact with the locking balls, or the shear strength of the balls at the plane of loading, whichever is the lower. Quality of fit, nature of loads, and required reliability of the assembly are all contributing factors that must be evaluated. Where tensile load is critical, special pin designs with four locking balls for maximum tensile

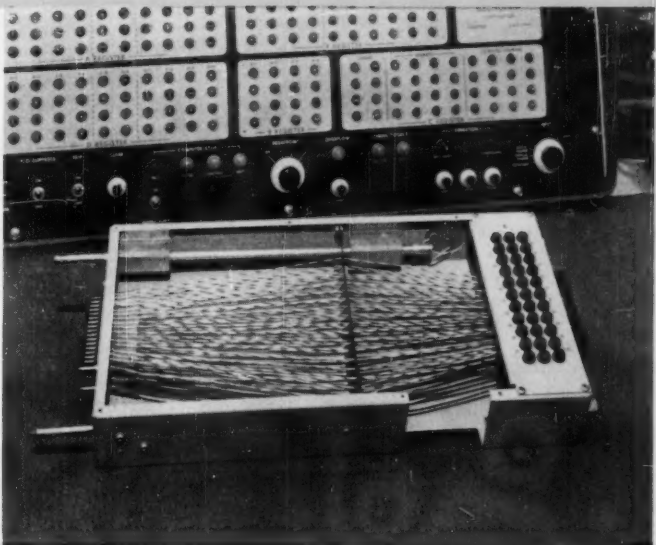

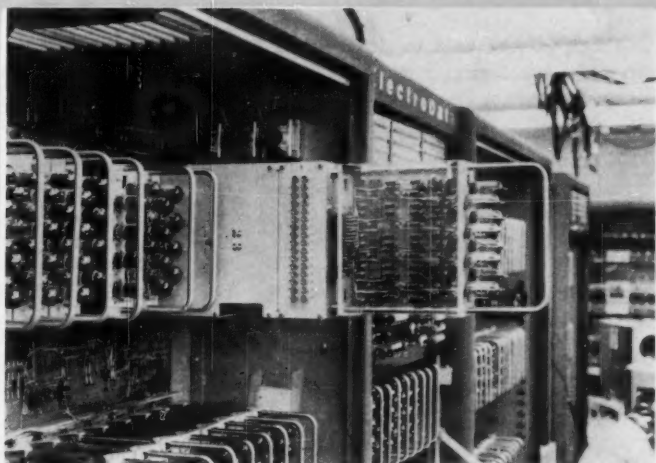

strength can be obtained.

In the specification and application of single-acting pins, some of the practical points discussed previously for the push-pull types should be kept in mind. These are, namely: Method of anchoring pin to structure, effect of environmental conditions, and accessibility of pin assembly.

DOUBLE-ACTING PINS: A modification of the single-acting type, these pins, Fig. 14, have a bidirectional spring-located plunger. That is, movement of the plunger in either direction along its barrel will release the locking balls.

Conventional form of this pin has a pull-ring at the head end with the tip of the plunger extending beyond the other end of the pin. An intentional blow on the protruding head or tip shifts

Testing of individual circuit "books," or modules, in the Datatron electronic digital computer is facilitated by a special extender unit. Mounted between the circuit book and computer chassis, the extender unit moves the circuit into an easily accessible position and provides a battery of plug-in test points for analysis of circuit components. The extender unit is mounted in place by a guide prong at the bottom and a long single-acting quick-release pin at the top of the extender unit. Purpose of the pin is to furnish a firm cantilever support for the test assembly as well as to provide a means for quick installation and removal of the extender unit. Movement of the pin in assembly is prevented by two snap rings mounted in grooves in the pin body. Access to the push-button release mechanism of the pin is provided by a hole in the top of the extender-unit sheet-metal casing.

Photos, courtesy D. W. Price Corp.

the plunger, releasing the balls and permitting the pin to be driven in or out of the hole. In addition, direct manual removal of the pin may be accomplished by means of the pull ring.

Commercial size and material specifications for these pins are essentially the same as for the single-acting types except for one detail. Minimum grip lengths vary from 0.20 in. in the 1/4-in. size to 0.9 in. in the 1-in. size.

General range of application of the double-acting pins is, by and large, the same as for the single-acting types with one qualification. These pins are recommended primarily for use where normal

structural distortion, or other loads on joint and pin, can cause hole misalignment and binding problems. Under such conditions, the drive-in, drive-out feature of these pins offers practical advantages in assembly and disassembly.

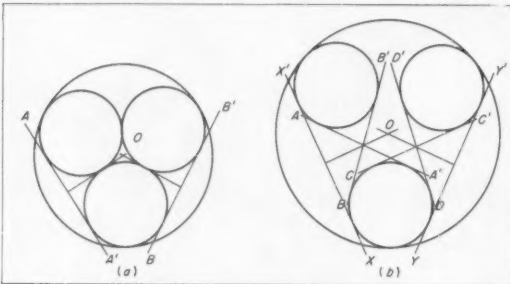

EDITOR'S NOTE

On behalf of the National Aircraft Standards Committee, a preliminary survey to evaluate all of the various types of pins used in the aircraft/rotorcraft industry has been completed by Hiller Helicopters' NASC representative: J. Edward Kampf, Supervisor, Engineering Standards and Procedures, Hiller Helicopters, Palo Alto, Calif. Studies are now underway to standardize these types of fasteners through a series of NAS drawings. Any additional information, comments, or suggestions that may be of help in this effort will be welcomed by Mr. Kampf.

Tips and Techniques

Circumscribing Circles

Two methods may be used to circumscribe a circle about three equal circles when the centers of the given circles are not known.

Tangent Circles (a);

1. Draw tangents AA' and BB'
2. Erect perpendiculars from the tangent lines, passing through contact points of the respective circles.
3. Intersection O , of these perpendiculars is the center of the circumscribing circle.

Nontangent Circles (b);

1. Draw crossing tangents AA' , BB' , CC' , and DD' .
2. Draw outside tangents, XX' and YY' .
3. Erect perpendiculars from XX' and YY' , passing through the intersections of lines AA' , BB' , and CC' , DD' respectively.
4. Intersection, O , of these perpendiculars is the center of the circumscribing circle.

—C. G. ROY, technical assistant, Indian Institute of Technology, Mechanical Engineering Dept., Kharagpur, India.

Accurate Circle Computations

Multiples and reciprocals of pi are convenient for computing circumferences and diameters of circles. Practically any desired degree of accuracy can be

obtained, and since the only operation performed is addition, it is easy to check the results.

Table 1—Multiples and Reciprocals of Pi

Integer N	Multiple πN	Reciprocal N/π
1	3.14 159 265	0.31 831
2	6.28 318 531	0.63 662
3	9.42 477 796	0.95 493
4	12.56 637 061	1.27 324
5	15.70 796 327	1.59 155
6	18.84 955 592	1.90 986
7	21.99 114 857	2.22 817
8	25.13 274 123	2.54 648
9	28.27 433 388	2.86 479

As an example of the use of the table, the circumference of a circle of 28.153 diameter, correct to three decimal places, is

$$\begin{aligned}
 20\pi &= 62.8318 \\
 8\pi &= 25.1327 \\
 0.1\pi &= 0.3141 \\
 0.05\pi &= 0.1571 \\
 0.003\pi &= 0.0095 \\
 \hline
 &88.4452, \text{ or}
 \end{aligned}$$

88.445 to three decimal places

The diameter corresponding to a circumference of 28.153, correct to three decimal places, is

$$\begin{aligned}
 20/\pi &= 6.3662 \\
 8/\pi &= 2.5465 \\
 0.1/\pi &= 0.0318 \\
 0.05/\pi &= 0.0159 \\
 0.003/\pi &= 0.0009 \\
 \hline
 &8.9613, \text{ or}
 \end{aligned}$$

8.961 to three decimal places.

The value of $\pi = 3.1415926536$ was used for obtaining the multiples of pi and the values then rounded off to eight decimal places; 0.3183099 was used for the reciprocal of pi and the computed values rounded off to five decimal places.—F. MURRAY, Chicago, Ill.

Chart for finding Kinematic Viscosity and Reynolds Number

By **KENNETH A. MERZ**

Assistant Chief Engineer
Air Impeller Div.
Torrington Mfg. Co.
Torrington, Conn.

FAN and blower systems for cooling airborne electronic equipment are usually more difficult to design than sea-level systems because of the changed physical characteristics of air as a heat-transfer medium at high altitudes. Space for air flow in aircraft is limited, and air density is low. Therefore, air is usually delivered at extremely high velocities in order to remove a given quantity of heat from power tubes, transformers, or other electronic components which produce high temperatures.

Two basic characteristics of air if known for a particular airborne cooling system allow determination of the heat-transfer film coefficient: 1. Kinematic viscosity, ν . 2. Reynolds number, N_R . Kinematic viscosity is the ratio of absolute viscosity, μ , to fluid density, ρ . Since absolute viscosity rises with temperature and density drops with decreasing pressure (high altitudes), kinematic viscosity can be extremely high in airborne cooling systems. The significant pressure, of course, is that maintained in the actual cooling section.

Reynolds number is a dimensionless measure of air-flow condition given by the expressions

$$N_R = \frac{2Q}{\nu(\pi r)} \quad (\text{round duct})$$

and

$$N_R = \frac{2Q}{\nu(a+b)} \quad (\text{rectangular duct})$$

where Q is air flow rate, a and b are side dimensions of a rectangular duct, and r is the radius of a circular duct or flow path.

The chart in Fig. 1 gives kinematic viscosity

as a function of temperature in the heat-transfer area for various altitudes in the electronic section from sea-level to 100,000 ft. Reynolds number is given at values above 30,000 for turbulent flow only. It is not likely to be lower in airborne applications and can be obtained from the known kinematic viscosity, required flow rate Q , and duct or flow path dimensions, whether rectangular or round.

Example: In the example illustrated in Fig. 1, values of kinematic viscosity and Reynolds number are desired for an air temperature of 200 F, altitude of 60,000 ft, flow rate of 500 cfm, and a 3 x 4-in. rectangular duct. A vertical line from 200 F on the temperature scale intersects the curve

Nomenclature

- a = Side dimension of rectangular duct, in.
- b = Side dimension of rectangular duct, in.
- N_R = Reynolds number
- Q = Air flow rate, cfm
- r = Radius of circular duct, in.
- μ = Absolute viscosity, lb per ft-sec
- ν = Kinematic viscosity, sq ft per sec
- ρ = Fluid density, lb per cu ft

for 60,000 ft at point A. A horizontal line from point A intersects the viscosity scale at 35×10^{-4} sq ft per sec. A line from this point through 500 on the flow-rate scale meets the reference line at point B. Finally, a line from point B through 7 on the scale for rectangular ducts (equivalent to a round duct with a $2\frac{1}{4}$ -in. radius) intersects the Reynolds number scale at about 500,000.

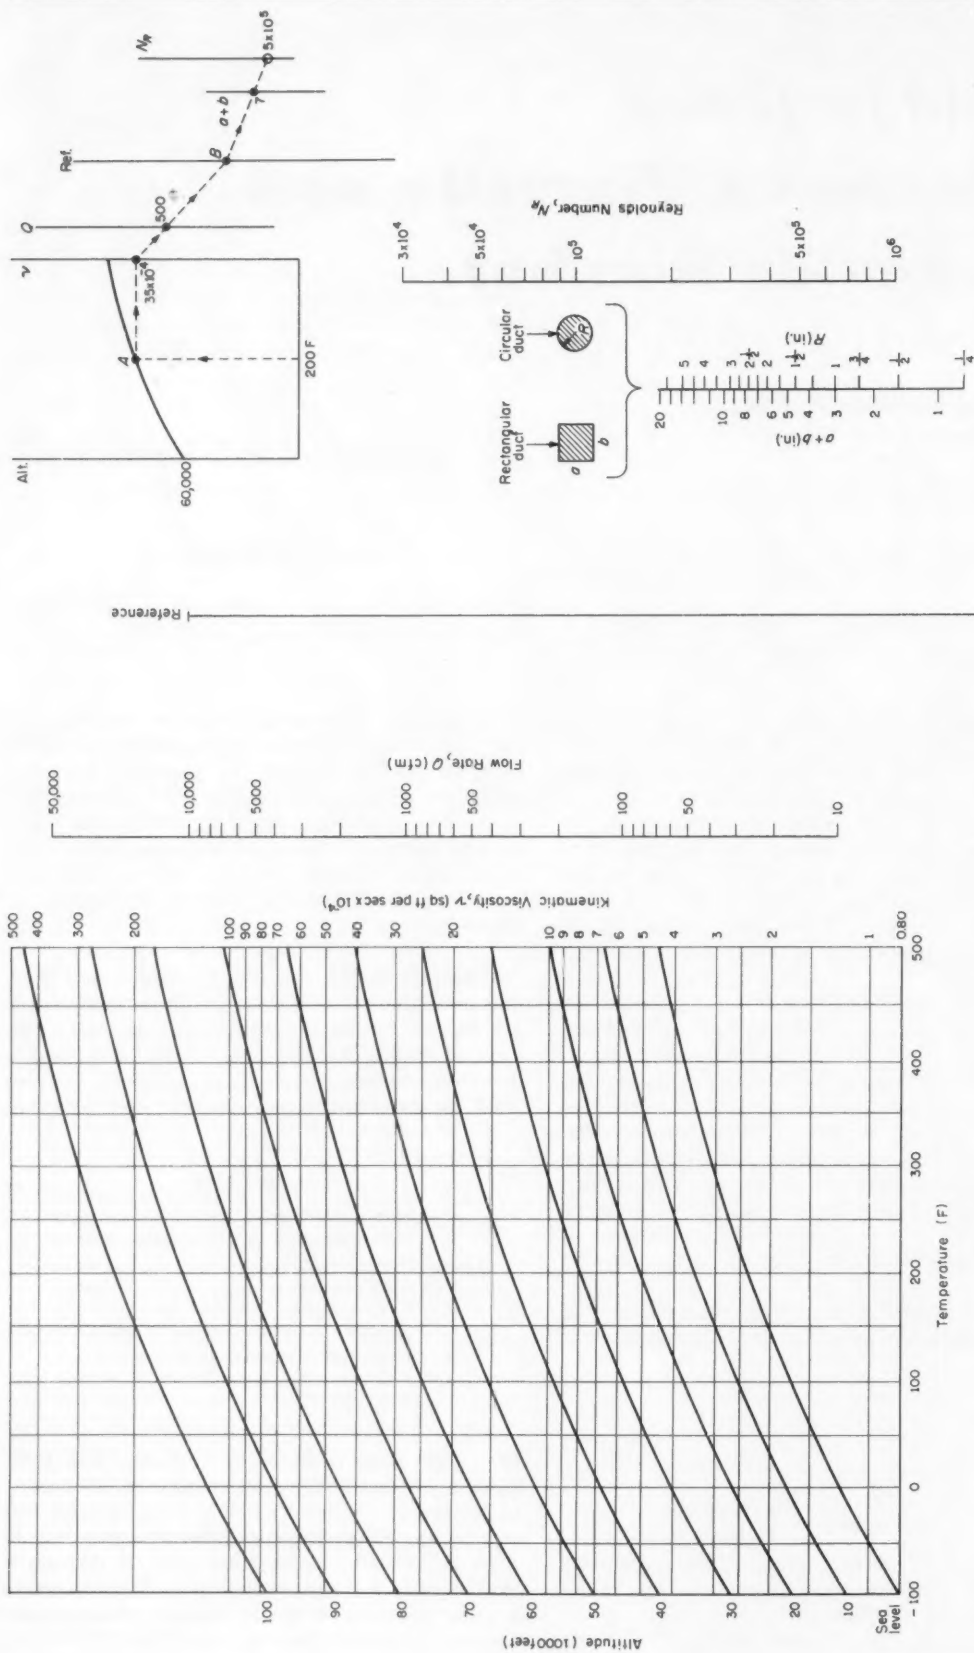

Fig. 1—Chart for determining Reynolds number and kinematic viscosity as a function of altitude, temperature, flow rate, and duct dimensions.

Properties of Cellular Plastics

By LEON TALALAY

Director of Research and Development
B. F. Goodrich Sponge Products Div.
B. F. Goodrich Co.
Shelton, Conn.

NEW cellular plastic materials in rigid and flexible form make it possible to design a large number of products to perform specific functions. In the past, cellular materials based on rubber had a relatively fixed range of properties and were not as adaptable to specific applications.

Flexible Cellular Materials

Rubber, vinyl, and urethane are the major contenders in the field of flexible cellular materials. Fig. 1 shows the relative stress-strain relationship of four materials: Rub-

ber foam, vinyl foam, and two types of urethane foam.

The curve for an early polyester urethane foam, Type 1, shows a characteristic discontinuity which makes it an undesirable material for certain applications such as comfort cushioning. Resistance to compression builds up rapidly, then changes at a certain level of deflection. Polyurethane foam, Type 2, however, shows more desirable stress-strain characteristics since it has a much lower density for the same compression-load carrying capacity and is based on inexpensive raw materials.

Shock Absorption: Fig. 2 shows hysteresis observed on loading and

unloading the four types of materials under discussion. Data were obtained at a rate of 10 in. per min and materials were compressed by 75 per cent of their original height. Polyester type of urethane exhibits remarkable properties of shock and energy absorption. The others, particularly rubber foams, have too little hysteresis loss to be good shock absorbing materials. The faster the rate of loading, the greater the hysteresis loop becomes with urethane, while little change is observed with rubber.

Rebound elasticity of the various materials is a relevant fact in shock protection. In addition to being able to absorb the energy

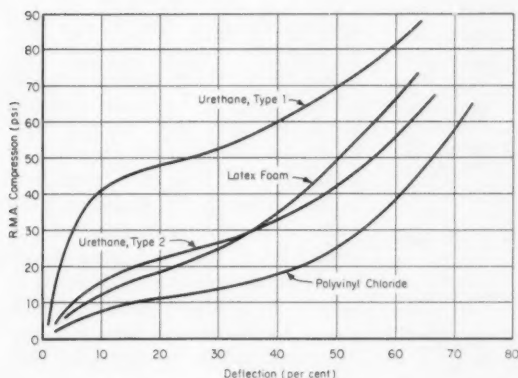

Fig. 1—Compression-deflection curves for rubber foam, vinyl foam, and two types of urethane foam. The curve for polyester urethane foam, Type 1, shows a characteristic discontinuity which makes the material undesirable for certain applications. Polyurethane foam, Type 2, has a much lower density for the same compression-load carrying capacity.

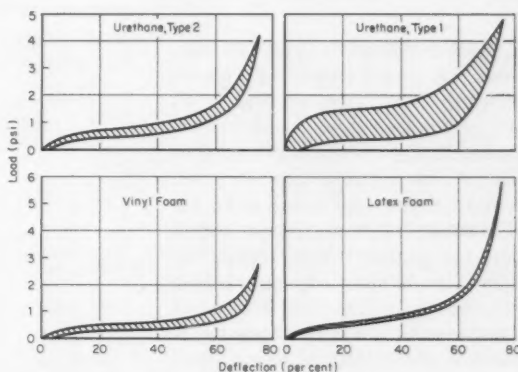

Fig. 2—Hysteresis loops observed on loading and unloading rubber, vinyl, and urethane foams. Materials were compressed by 75 per cent of their original height. Rubber foams have too little hysteresis loss to be used in applications requiring good shock absorbing properties.

of shock, the material, for proper protection, should have relatively little rebound elasticity. Urethane polyester foam, Type 1, has the lowest rebound elasticity of the flexible materials under consideration, although vinyl foam is a close second. Rebound elasticity of polyester urethane is about 30 per cent as compared to 75 per cent for natural latex foam rubber.

Sound Absorption: Fig. 3 shows absorption coefficients of three soft and one rigid cellular material at various frequencies. All materials are quite good in the range of medium frequency vibrations. Data for the rigid polystyrene foam seem to indicate that it is not too satisfactory a material. However, good results have been obtained in noise level reduction through the use of rigid cellular plastic panels having a pattern of perforations.

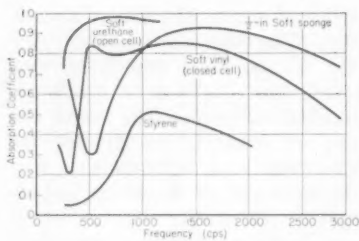

Fig. 3—Sound absorption coefficients of three soft and one rigid cellular material at various frequencies. Despite the low coefficient of absorption for rigid styrene foam, satisfactory results were obtained in noise-level reduction tests with perforated styrene panels.

Tensile Strength and Elongation: A comparison of tensile strength and elongation-at-break of the various cellular materials are shown in Fig. 4. Strength properties of the material are very important factors for some given applications. The open bars represent the tensile/density index obtained by dividing absolute tensile strength in psi by the density of the material tested in lb per cu in. Because the density at which these materials are made for a different load-carrying service might be widely different, the tensile/density index is a truer expression of the comparative strength of these cel-

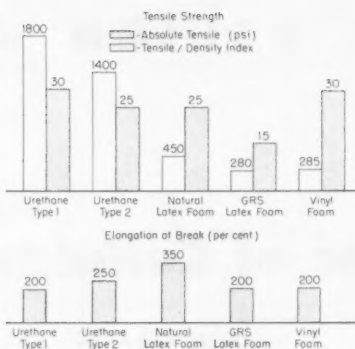

Fig. 4—Comparison of tensile strength and elongation-at-break of various cellular materials. The tensile/density index, represented by the open bars, is a truer expression of comparative strengths of these materials than values shown for absolute tensile strength.

lular plastic materials.

Urethane Type 1 and Type 2 are considerably superior to both natural and synthetic rubber foam and to vinyl, taking into account its higher density. This is also true of abrasion resistance, although no good means of measurement has yet been found for this property.

Elongation-at-break is rather similar for most cellular materials. However, natural-rubber foam has an elongation-at-break of 350 per cent or more although, generally speaking, this property is not too important because most cellular materials are used in compression.

Tear Strength: Fig. 5 shows a rather more significant difference between rubber and cellular plastic materials as found in the property of tear resistance. Plastic cellular materials are vastly superior in tear strength to rubber foam, and vinyl foam appears to have the highest tear resistance.

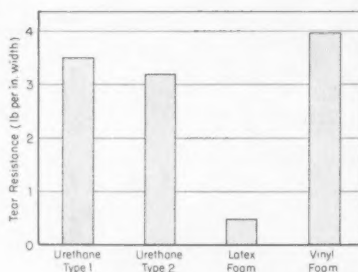

Fig. 5—Relative tear resistance of rubber and cellular plastic materials. The plastic foams are greatly superior in tear strength to rubber foam.

Flexing Properties: Ability of a cellular material to withstand repeated compression deformation is shown in Fig. 6. Softening or compression loss of the various materials is shown for two rates of flexing. One is low-speed flexing at 1 cps and the other is high-speed flexing at 25 cps. Here, the picture does not look quite as good for the cellular plastic materials. Also, significance of the high-speed flexing test is not yet clear. High-speed flexing data apply only to transportation seating, aircraft, etc. at this time. Of the cellular plastic materials, the polyether type urethane is best.

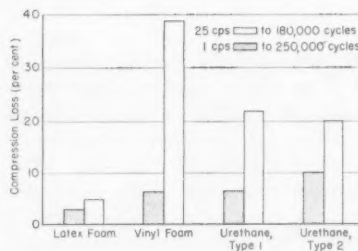

Fig. 6—Softening or compression loss of plastic and rubber cellular materials. Low-speed flexing was carried to 250,000 cycles at a deflection of 50 per cent of the original material height. High-speed flexing was carried to 180,000 cycles at a 25 per cent deflection. Loss of hardness was determined after the test at 50 per cent compression.

Humid Aging: One special permanence property which has received attention recently is humid-aging performance of urethane foams. A requirement of any cellular material is that it age well on a long-term basis. Normal heat-aging tests which have been applied in the past to rubber systems show very little with cellular plastic foams. It has been observed in a number of instances that urethane foams do not stand up very well in humid atmospheres. A humid-aging test has been developed which consists of keeping a sample in a warm humid atmosphere to determine whether any depolymerization or softening has occurred.

Urethane foams of the polyester type do suffer a loss in properties when exposed to a warm humid atmosphere. The situation is greatly improved with the polyether

type of urethane, properly formulated, and it is generally agreed now that these materials will age well on a long-term basis.

Rigid Cellular Materials

Generally important properties of rigid foams are listed in Table 1. Quite a number of materials qualify as rigid cellular bodies, but the major ones are polystyrene, vinyl (frequently of the closed-cell type), and polyurethane. The others are rather special in their application and only limited amounts of them have been produced.

Most of the materials can be made in a wide range of densities, some of them amazingly low such as phenolic or urea formaldehyde foams available in densities of less than 1 lb per cu ft. Polyethylene is at the other end of the density scale in a class by itself. Strictly speaking, polyethylene is not a rigid material. One of the fundamental properties of a rigid foam material is compressive strength.

Thermal conductivity of all rigid foams is quite low and, in fact, approaches quite reasonably the thermal conductivity of still, dry air. It is for this reason that almost all of the rigid foam materials have been used for insulating purposes. There is a great difference in heat-distortion points. Some foams are distinctly thermoplastic such as polystyrene and vinyl, while others could definitely be considered as thermoset types such as epoxy, ebonite, silicone, and phenolic foams. Cellulose acetate is a somewhat intermediate material. It is thermoplastic in nature but at the same time has a very high heat-distortion point.

With regard to urethane foams, the heat distortion point is approximately 210 to 250 F but, recently, urethane foam materials have been developed which have heat-distortion points considerably higher. A material known as poly-methyl-polyphenol isocyanate is claimed to have a distortion point of 500 F.

Amount of water absorption distinguishes the closed-cell type from the open-cell type of foam, Table 1. Some of these foams, especially the closed-cell vinyls, are excellent for floatation applications. In general, while rigid foams have not advanced as rapidly as the flexible materials, they have an even greater potential than flexible foams. Probably their most promising future lies in their use in structural applications and as core materials for sandwich construction.

Tensile Strength: Relationship of tensile strength to density for the three major materials is shown in Fig. 7. While tensile strength of a rigid material is not necessarily the most important structural

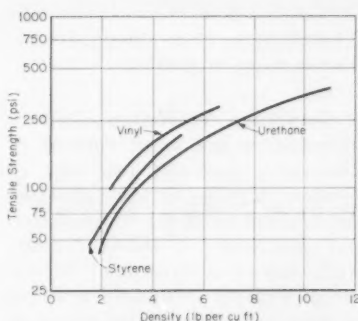

Fig. 7—Relationship of tensile strength to density. While not necessarily an important property, tensile strength is a measure of the strength of the polymer used in building the body of the cellular plastic material.

Table 1—Properties of Rigid Foams

Type	Density (lb per cu ft)	Compressive Strength (psi)	Thermal Conductivity (btu/in./hr/sq ft/F)	Heat Distortion (F)	Water Absorption
Polystyrene	1.6-4.5	18-140	0.25	155-175	Low
Cellulose acetate	6.0-7.0	115-135	0.31	350	Low
Vinyl	2.0-5.0	20-100	0.23-0.25	150	Low
Urethane	2.0-20.0	4.5-475	0.21-0.25	212-250	Moderate
Polyethylene	29	Low
Silicone	10.0-20.0	100-475	0.31	500-700	Low
Phenolic	0.3-14.0	0-500	0.21-0.25	260-350	Moderate
Urea formaldehyde	0.75-1.0	0-5	0.18-0.21	120	High
Epoxy	2.0-16.0	7-460	300	Low
Ebonite-hycar	6.0-20.0	30-400	0.24	300	Low

CELLULAR PLASTICS

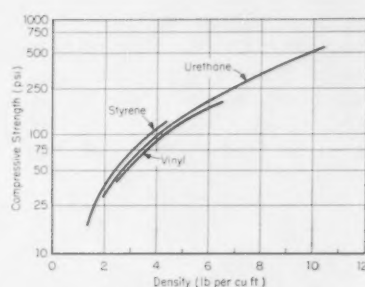

Fig. 8—Compressive strength or crush resistance of rigid cellular plastics. Compressive strength varies greatly with density and is a measure of the ability of the material to withstand load to the point at which it begins to yield.

property, it is a measure of strength of the polymer used in building the cellular body. Urethane outranks the other materials because it maintains its strength up to 200 F while vinyl and styrene quickly lose theirs.

Compressive Strength: A more fundamental measure of the structural properties of a rigid material is its compressive strength or crush resistance. Compressive strength to failure for styrene, urethane, and vinyl foams is shown in Fig. 8. In general, the materials are in the same order of magnitude regarding strength. This compression strength is a measure of the ability of the material to support load up to the point at which it begins to yield, and varies greatly with density. Again, this factor depends on temperature and is better for thermoset, cross-linked materials such as urethane.

Modulus of Elasticity: Fig. 9

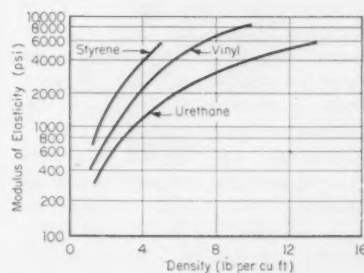

Fig. 9—Modulus of elasticity of rigid foam. This property, together with the relatively high compressive strength, makes the material suitable for use in sandwich structures.

probably defines the most important property of a rigid foam material. The modulus of elasticity is the property which, together with the relatively high compressive strength, enables these materials

to be used in sandwich structures. Here, there is somewhat of a difference between materials. Styrene foam has the highest modulus of elasticity and is the most rigid foam at room temperature. However, while the modulus of elasticity of urethane is lower, it main-

tains its modulus of elasticity better at elevated temperatures.

Types and applications of *Thermistors*

Thermistors are used in applications where it is desirable to change or adjust resistance of an electrical circuit without any moving parts, or where it is necessary to control or measure temperature, or counteract effects of temperature variations in electrical circuit components.

A THERMISTOR is a resistor whose value varies with temperature in a predetermined manner. The word "thermistor" is a contraction of thermal resistor, a term descriptive of thermistor characteristics.

Principal uses and applications of thermistors come from their large change in resistance with very small changes in temperature. Resistance of thermistors decreases as their temperature rises and increases as it falls. This characteristic is directly opposite to that of ordinary resistors that normally have small positive temperature coefficients.

Construction: Thermistors are made of various mixtures of the oxides of manganese, nickel, cobalt, copper, uranium, iron, zinc, titanium, and magnesium. These semiconducting materials are mixed in proper proportion to get required resistance and temperature coefficient of resistance for particular applications.

Mixtures are formed into various shapes and sintered under accurately controlled atmospheric and temperature conditions. The finished product is a hard ceramic material that may be mounted in many ways depending on mechanical, electrical, and thermal requirements.

Thermistors have good stability,

are mechanically rugged and shock resistant, make permanent electrical contacts, have a wide range of resistance, temperature coefficient, and power dissipation. They are small, compact in size, and have unlimited life when operated within maximum temperature ratings. Thermistors have three forms: Beads, disks or washers, and rods.

Bead-Type Thermistors: Bead thermistors are small spheres of thermistor material that can be formed on two parallel platinum wires. Spacing of the wires, chemical composition of the bead material, and heat treatment of the bead element are the principal factors which determine electrical characteristics of the bead.

The beads are mounted in various ways for many different applications. They may be enclosed in very thin glass or mounted in gas-filled or vacuum bulbs. Bead-type thermistors are used for high-frequency power measurement, oscillator amplitude control, and flow-rate detection. They are also used as the sensing device in measurement of extremely small differential temperatures.

Some bead thermistors are indirectly heated. These types have a more complicated construction. The bead is surrounded by, but electrically insulated from, a separate heater to which power is

applied to heat the thermistor. In this manner, the temperature of the thermistor and, consequently, its resistance, can be changed or controlled.

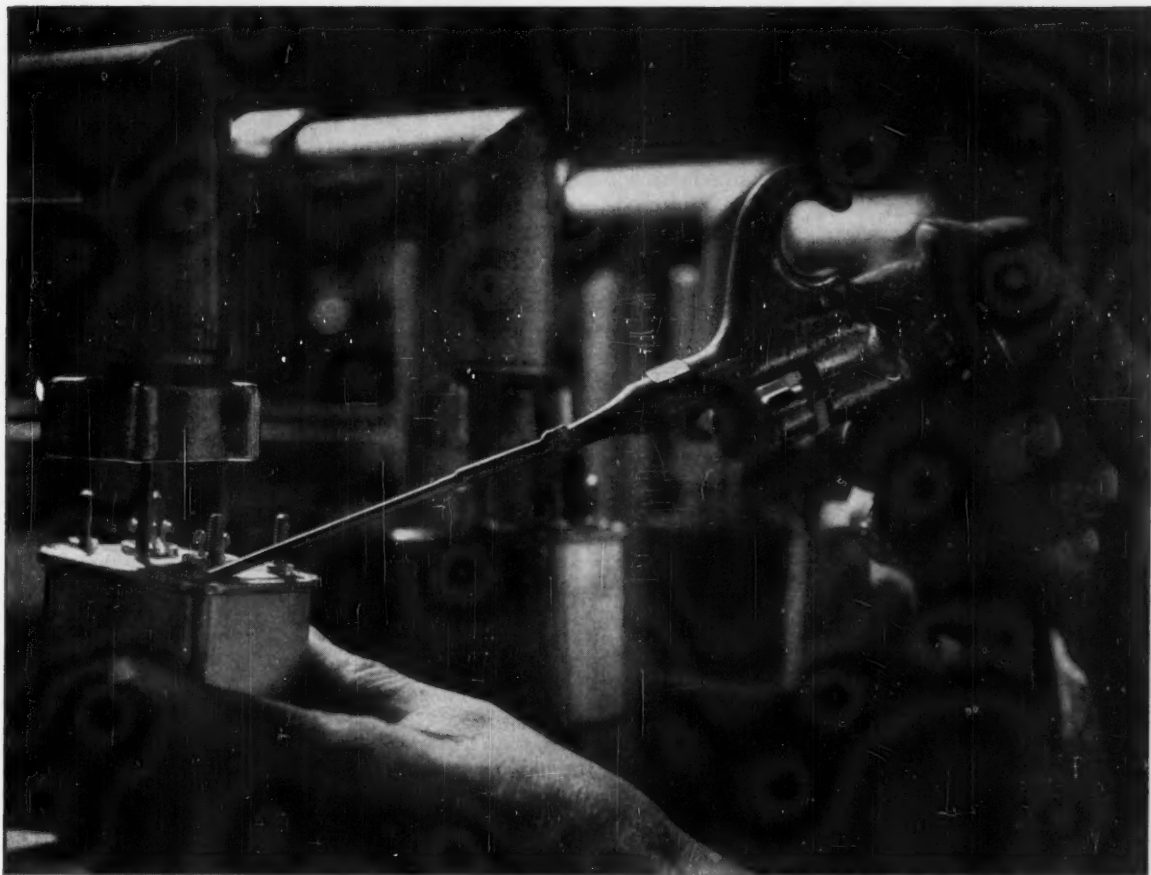

Bead thermistors can be modified to adapt them to widespread uses. Because of their small size, they are ideal for devices with extreme space limitations and for the same reason, they respond rapidly to very small amounts of power. The smallest units have time constants in the neighborhood of $\frac{1}{2}$ sec.

Disk-Type Thermistors: Thin, large diameter units have a low resistance, short time constant, and high power dissipation. Thick, small diameter units have high resistance, long time constant, and low power dissipation. The disk shape is convenient for units placed in close thermal contact with flat metal surfaces.

Rod-Type Thermistors: Rod thermistors are made as long narrow rods of circular cross-section with contacts connected to the ends of the rods. These units have moderate power dissipation, long time-constants, and high resistance values.

Besides being used in most of the same ways as disks and washers, rods are used where high resistance is a consideration. Thermistor rods are useful as sensing elements, in electronic thermometers, temperature actuated controls, and compensators for temperature effects in electronic circuits, and for time delay.

Electrical resistance of the thermistor is a function of its absolute temperature and, consequently, all of its useful characteristics are based on the fact that its resistance will change as its temperature changes. Methods of producing temperature changes with consequent resistance changes in ther-

Tracer gas is sprayed over the relay enclosure while it is under high vacuum

STANDARDS THAT DETERMINE RELAY QUALITY /

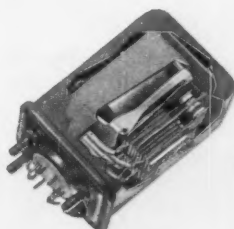

100% leak-free hermetic sealing

We reject relays with leaks so tiny that it would take 30 years to admit 1 cubic centimeter of air!

Hermetically sealed relays are safe from the dangers of human tampering, and from severe conditions of dust and dirt, sand, moisture and high humidity, fungi, salt spray and reduced air pressure. To insure this safety, however, sealed relays must be absolutely free from leaks.

That is why, at Automatic Electric, every single hermetically sealed relay undergoes a sensitive mass spectrometer test. This highly refined method of testing detects leaks so tiny that it would take *more than 30 years for one cubic centimeter of air to pass through!* To protect you, we reject "leakers" able to pass ordinary immersion tests with ease.

Thanks to uncommon care like this at every step of manufacture, Automatic Electric relays are the most reliable you can buy.

*Hermetically sealed relays are available in many varieties. Write today for Catalog 4083 PD. Automatic Electric Sales Corporation, Northlake, Ill.

AUTOMATIC  ELECTRIC

A member of the General Telephone System
One of America's great communications systems

mistors may be divided into three major groups: Thermal, electrical, and physical.

Thermal Control: When a thermistor is used in an electrical circuit in such a way that power dissipated in the thermistor is insufficient to heat the thermistor above its surrounding temperature, the temperature of the thermistor will be the same as ambient temperature.

Under these circumstances, resistance of the thermistor becomes a function of ambient temperature and, therefore, can be used to measure variations in ambient temperature. This characteristic makes the thermistor useful for temperature measurement, temperature control, and temperature compensation.

By connecting a thermistor to a fairly simple resistance measuring device, temperatures may be measured easily to a precision of a thousandth of a degree. By using thermistors with suitable electronic equipment, temperatures may be controlled with even greater precision.

Thermistors may also be used to counteract effects of temperature variations in other electrical

circuit components such as meters of conductors with positive temperature coefficients of resistance.

Electrical Control: Thermistors may be connected into electric circuits in such a way that power dissipated in the thermistor heats the thermistor appreciably above ambient temperature. To get this dissipation of power, heat produced in the thermistor itself may be used, or heat may be produced by a small heater coil very closely associated with the thermistor.

Under these circumstances, resistance of the thermistor is a function of power dissipated in the thermistor or in its electrical heater.

When power is applied to a thermistor, there is some lag between application of power and heating of the thermistor to its final temperature. Length of the time lag is a function of the thermal mass of the thermistor and its associated heater.

A bead thermistor that has extremely small thermal mass will react very rapidly and may give time delays of a small fraction of a second. With larger thermistors, time delays of the order of minutes are also feasible.

There are many applications for thermistors that put these resist-

ance-temperature characteristics to use, such as constant voltage controls, constant current controls, power level and gain controls in amplifiers, surge suppression, overload protection, and time delay.

Control of Physical Conditions: When a thermistor is used in a circuit in which the thermistor is heated above its ambient temperature, the temperature to which the thermistor is raised is a function of a construction of the thermistor and its surroundings.

Changes in environment produce changes in the temperature and consequently in the resistance of the thermistor. This characteristic makes it possible to measure changes in environment by means of the resistance of the thermistor.

For example, a thermistor electrically heated in still air will reach a much higher temperature than when it is similarly heated in moving air. Useful applications for thermistors that make use of this characteristic include measurement of gas composition by thermal conductivity, measurement and control of flow rate of liquids or gases, and measurement and control of pressure and liquid level.

Welding and brazing of *Precipitation-Hardening Steels*

By **F. K. LAMPSON**

Marquardt Aircraft Co.
Van Nuys, Calif.

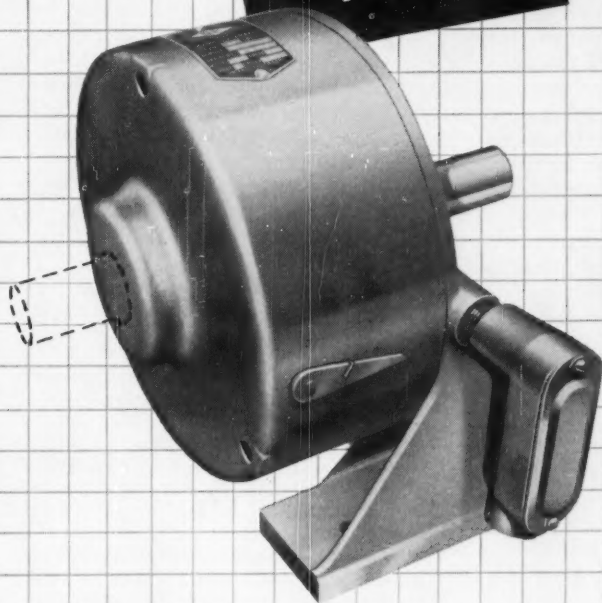

WELDING and brazing of PH steels differ from the ordinary 400 series stainless steels in that they can be joined in the austenitic condition where susceptibility to cracking is decreased. Categorically, it appears that AM 350, AM 355, and Armco 17-7 PH stainless steels should be fusion welded in the annealed condition, followed by heat treating operations in order to achieve maximum

weld efficiency. For tungsten inert gas arc processes, which are ideally suited for these materials, filler metal should be of the same nominal composition as the base metal. In cases where the material may be required to be welded in the hardened condition, or where the strength of the weldment is secondary, it is permissible to fusion weld these materials using filler metal of the same type used

for welding austenitic stainless steels.

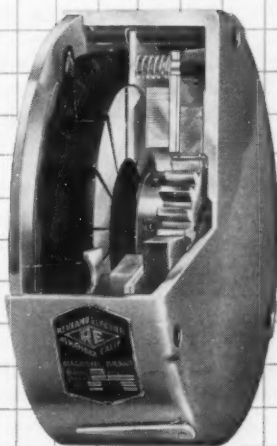

Aluminum Oxidation: One problem which is inherent with the 17-7 PH grade is that of the danger of loss of aluminum by oxidation during the welding process. The problem of aluminum oxidation is decreased in the tungsten inert gas welding process by using slightly higher argon gas coverage than

SHAFT and BEARINGS**

**First and Only Disc-Type Brake to fulfill
J. I. C. Specifications**

The efficient, direct-action operating advantages of the Reuland disc type magnetic brake are now available for the first time in this self-contained unit. Being foot-mounted, it can easily be coupled to existing motor or equipment shafts in accordance with J.I.C. specifications. As a standard unit it also can be purchased "off the shelf" by O.E.M.'s or added to equipment at any time by users. Available with either single or double end shaft.

Also available without shaft Reuland disc type magnetic brakes are also supplied for applications where the motor or equipment shaft can be extended directly into the brake. These units are available in both foot-mounted and endbell mounting types. Together with the completely self-contained unit described above, these brakes provide low cost, compact size and efficient operating features that are unequaled.

Reuland Brakes provide great versatility

Shaft can be extended entirely through brake, when desired. Also, hook-ups with Reuland Fluid-Shaft motors and Motoreducers permit many J.I.C. and other unique power and braking combinations... combinations that can be tailored to your exact drive requirements without huge, special development costs.

normally used for austenitic stainless steels. Argon gas provides a protective gas coverage which prevents oxygen in the air from coming in contact with the aluminum of the steel. Metallic arc welding of 17-7 PH is normally accomplished using flux-covered electrodes of 17-4 PH composition. Metallic arc electrodes to 17-7 PH composition are not normally manufactured because the flux coating does not provide sufficient protection to prevent oxidation of the aluminum content.

Welding A-286 Alloy: Fusion welding of A-286 alloy should be performed upon material in the annealed, or solution treated, condition, since this alloy is very susceptible to cracking during welding in the fully aged condition. Considerable success has been achieved using filler metal with Hastelloy W (Ni-base Cr-Mo) composition where the technique is adjusted to require favored dilution of the base metal. Several large consumers of this material have reported considerable success using filler metal to the base metal composition, a situation which is to be preferred where the part is to be heat treated after welding.

Brazing: Brazing of 17-7 PH steels with brazing materials of the silver-manganese type has been widely accepted, primarily in the fabrication of honeycomb panels and structures. It has been reported, however, that silver-manganese brazed joints are subject to crevice-corrosion. Additions to the composition of such elements as lithium and/or nickel have been attempted

with varying degrees of success. Brazing cycles are normally coordinated with the "double aging" type of heat treatment, with the result that this material provides the ultimate in high strength, low density structures for use up to 800 to 1000 F, depending upon time of exposure. Here again, however, aluminum presents problems with regard to oxidation, with the result that brazing operations are carried out in dry hydrogen atmospheres. There have been cases reported where the brazed assembly was covered with a white powder after the brazing cycle, with the white residue being identified as aluminum oxide. This condition indicated that the aluminum content of the base metal has been depleted, a condition which is dangerous because the austenite becomes stable and full response to heat treatment is not realized and results in a weakened structure. It is believed that dry hydrogen atmosphere with dew points lower than -50 F are required to prevent oxidation of aluminum during brazing.

There has been very little production brazing of AM 350 and 355 steels, but the composition indicates that little difficulty would be encountered using conventional brazing filler materials. This has been verified by several of the large aircraft manufacturers.

Brazing A-286 Alloy: Nickel alloy brazing of A-286 alloy presents many problems due to the presence of aluminum and titanium. These elements are not reduced by hydrogen, with the result that normal brazing techniques performed in a dry hydrogen atmosphere are not sufficient to achieve reproduc-

bly satisfactory bonds. To support the theory that it is the presence of titanium and aluminum that creates the difficulty when brazing A-286 material, it has been shown that as-forged parts, with one surface finish machined, have been found to bond perfectly along the as-forged surfaces but not along the machined surfaces. It is believed that aluminum and titanium, which are easily oxidized, are depleted from the as-forged surface, a condition which results in satisfactory bonding due to the increased wettability of the nickel alloy brazing alloy and the base metal.

The following procedure for nickel alloy brazing has been found to work very well:

1. Subject the part to brazing temperature and atmosphere in the absence of braze filler metal.
2. Vapor blast the parts.
3. Braze at 1950 F using AMS 4778 filler metal with a dew point of -60 F or better.

The vapor blasting operation, which removes the surface layer of titanium and aluminum leaves a surface which is metallurgically clean to the brazing filler metal. Recourse to AMS 4778 filler metal in lieu of the more familiar AMS 4775 filler metal is required for particular operations but AMS 4777 has been found to work very well. Both AMS 4777 and 4778 appear to have greater wettability than AMS 4775 material, and are considered better for the brazing of A-286 alloy material.

From a paper entitled "Metallurgical Design Considerations for Precipitation Hardening Steels up to 1200 F," presented at the SAE National Aeronautic Meeting in Los Angeles, Calif., October 1957.

How to develop Maximum Reliability of a Design

By G. S. SCHAIRER and H. S. CLAYMAN

Boeing Airplane Co.
Seattle, Wash.

A DESIGN, as initially conceived and released from the drawing board, has the capability of eventually reaching some

maximum value of reliability that might be described as its potential reliability. It is the reliability that is expected from this design

after components and systems have become fully developed. Despite the best efforts, initial reliability will normally be subject to im-

ONE OF THE GARLOCK 2,000

Model 47J Bell Helicopter

Garlock KLOZURES* Specified on Bell Helicopters for 10 years

Since 1947 Bell Helicopter Corporation engineers have consistently specified Garlock KLOZURE Oil Seals for twelve different sealing functions. These KLOZURES serve in both low speed and high speed capacities contributing in no small measure to the outstanding performance and leadership of Bell Helicopters in that industry. Bell reports these seals have a minimum satisfactory life exceeding the required 600 hour overhaul.

The standard sealing element in a Garlock KLOZURE Oil Seal is a unique synthetic material molded to very accurate dimensions. It is non-abrasive, free-running; resistant to oil, grease, heat, and cold; impervious to water, mild acids, and alkalis. It is also extremely durable and resilient. For unusual service requirements sealing elements made of silicone rubber for temperature extremes or Teflon for resisting strong acids and other chemicals can be obtained.

A long list of satisfied users is added assurance that Garlock KLOZURES provide trouble-free bearing protection . . . sealing-in lubricants . . . sealing out abrasive dust and dirt. If you have a sealing problem, why not ask your Garlock representative for his recommendation from "The Garlock 2,000" . . . two thousand different styles of packings, gaskets, and seals for every need. The only complete line in the industry.

provement. With test and operational experience, changes can be introduced that allow the reliability potential of the design to be reached. The important point is that the potential reliability depends principally upon decisions made during initial design.

The designer faces the combined problem of making a design with high potential reliability and then conducting the subsequent design refinement program so that the reliability potential is realized as soon as possible, preferably before the customer becomes too deeply involved. This process of improvement from initial reliability to potential reliability is primarily accomplished by a feedback of operating experience and a follow-up with corrective actions. Corrective actions will result in design changes, retrofit modifications, and in modified operation and maintenance practices.

Design steps necessary to achieve a reliable product are:

1. Define reliability problem.
2. Define reliability terminology.
3. Establish reliability goals.
4. Assign responsibility.
5. Analyze reliability problems.
6. Accomplish laboratory tests to obtain design data.
7. Accomplish design and reliability analysis.
8. Carry out laboratory qualification tests.
9. Set up failure-data feedback programs.
10. Carry out follow-up actions.
11. Measure and evaluate overall product reliability.

Defining Reliability: Design actions must be implemented to establish reliability requirements of both the initial design and subsequent follow-up. Although it will be extremely difficult to tie the problem down, it is most important that this be done by establishing working definitions of what is meant by reliability, by evolving a standard terminology and by the establishment of reliability goals. It is necessary that this be accomplished in terms suitable for the design objectives and subsequent quantitative and qualitative performance evaluation. To the maximum extent possible, the problem must be defined and measured.

Establishing Responsibility: To obtain better reliability, not only must the reliability goals be established, but responsibility and authority for reaching these goals must be clearly assigned. This must include responsibility for an analysis to indicate that the design meets the intended goals to the best extent that it can be predicted. Analysis and design will frequently be the responsibility of two different groups as is the case in stress analysis which is normally not accomplished by design groups. A stress analysis usually concentrates on safety aspects but can be expanded rather readily in many areas to encompass other reliability considerations. Similar analysis reports should be prepared for all important elements affecting reliability.

Analyzing Reliability: An analysis on each subsystem of the design might contain a performance analysis detailing exactly what the system is expected to do, a failure analysis which considers ramifications of the failure of each individual component and categorizes each failure, and a probability analysis detailing probability of failure of each component utilizing the best available substantiating data. The report should give special consideration to multiple failures and any single failures which will result in a safety problem.

Qualification Tests: Formal qualification testing, distinct from the experimental nature of laboratory testing, is very important to the overall reliability program. The tests must be realistic and severe enough to simulate the range of expected practical operation. The testing must be accompanied by a complete recording of all difficulties. There must be a mandatory requirement for design correction of each new difficulty when it shows up for the first time.

Although qualification testing is important, it must be remembered that having one piece of equipment pass a test does not necessarily mean that the performance of large numbers of these items in the field will be equally satisfactory for either short or long periods of time. Testing should

simulate the customer's operation as closely as possible and equipment should not be protected unduly from hazards of normal operation. Steps must be taken to insure that workable operation and maintenance procedures are established during the program. Accelerated testing should be conducted by the manufacturer and customer at the earliest possible time.

Failure-Data Feedback: Malfunction reporting generally provides a statistical summary and a basis for corrective action. A statistical summary of all failures is necessary for a perspective as to which failures are more frequent, which failures are increasing in frequency, and also to correlate contributing factors. Not all corrective actions can be given equal priority. High risk and high-cost items must receive first attention. Statistical data are necessary from the beginning and will materially assist in determining where emphasis must be placed.

Statistical data alone, however, accomplishes nothing with respect to eliminating failure causes. Data must be sufficiently detailed and descriptive to permit the designer to ascertain the nature of the failure and to enable him to initiate corrective action. The man in the field should assume that each new difficulty, regardless of how small, is the first encounter of a problem which he will see many times.

Follow-up Action: These actions will be of many types ranging from design changes through inspection procedures to operating and maintenance actions. An improvement in the next component to come off the production line is not the complete solution to the follow-up problem. Parts already in the field must be given equal consideration. Often the designer is so isolated from the operator that he feels the problem is solved with a change of parts being built. The designer must assume the responsibility for planning the reliability improvement program and must include in his planning consideration of parts long since delivered.

From a paper entitled "Design for Reliability," presented at the SAE National Aeronautic Meeting in Los Angeles, October, 1957.

IN ELECTRICWARE, TOO,

Sharonsteel Quality STANDS OUT

• There are so many advantages to stainless electricware it's no surprise that sales are skyrocketing. Homemakers like the natural beauty of stainless—the way it easily absorbs the punishment of everyday use and stays forever new with a minimum of care.

• Sharon's thorough knowledge of the utensil industry, the ability to produce specification steels of consistent uniformity, plus the finest finishes in the industry are reasons why so many of the nation's leading electricware manufacturers specify Sharon Quality Stainless Steels.

Coordinate Cathetometer

Details of the new coordinate cathetometer are presented in Bulletin 194-57. This optical measuring instrument makes vertical and horizontal measurements and is suited for layout, inspection, research, and quality control operations. 2 pages. Gaertner Scientific Corp.

Circle 651 on Page 19

Tube & Bar Stock

Detailed information on standard bar and tube stock offered in GC Meehanite Metal, GA Meehanite Metal, and Type No. 1 Ni-Resist is presented in Bulletin 156. These centrifugally cast bars and tubes are suited for making bearings, bushings, gears, liners, pump and valve parts, pistons, sleeves, sprockets, and other items. 6 pages. Shenango Furnace Co., Centrifugally Cast Products Div.

Circle 652 on Page 19

Nonferrous Castings

Physical properties and conforming specifications for magnesium and aluminum alloys are tabulated in Catalog 57. Listings include alloys for sand castings, permanent mold castings, and rare earth alloys. 24 pages. Wellman Bronze & Aluminum Co.

Circle 653 on Page 19

Sprocket Chain

Usable for low-torque drives, manual controls, timing elements, and other applications, precision sprocket chain described in illustrated bulletin is of controlled-pitch, miniature type. Sizes range from 78½ to 34 links to the foot in 21 to 14-gage wire, respectively. 4 pages. Hodell Chain Co.

Circle 654 on Page 19

Regulator Valves

How to size OPW-Jordan sliding-gate regulator valves and how to adjust sizing for variations in pressure, temperature, viscosity, specific gravity, and other variables is explained in Bulletin J-SC. Charts cover steam, liquid, and gas services. 4 pages. Jordan Corp.

Circle 655 on Page 19

Stainless Steels

Strength factors, physical properties, chemical composition, typical applications, and thermal treatment for a series of stainless steels are given in illustrated brochure. Thirteen steels for diversified uses are covered. 32 pages. Sharon Steel Corp.

Circle 656 on Page 19

Relay

Features of Class E miniaturized telephone style relay are outlined and its specifications are given in "Relay

Highlights No. 14." Forms of standard contact springs are shown. Operation is on up to 150-v dc or 220-v ac. 2 pages. Automatic Electric Sales Corp.

Circle 657 on Page 19

Lubricator

Description and details of operating mechanism of a lubricator actuated by a machine's hydraulic cycle is found in illustrated Bulletin TR-57C. The Cyclic Y unit operates on line pressures from 500 to 3000 psi. 2 pages. Bijur Lubricating Corp.

Circle 658 on Page 19

Heat Treating Steels

Data on heat treatment of Croloy 2¼ alloy steels, Grades T22 and P22, are content of Alloy Sales Letter 289M. Covered are mechanical properties, isothermal transformation characteristics, and TTT diagram. 4 pages. Babcock & Wilcox Co.

Circle 659 on Page 19

Ceramic Seal Material

Ceramicite C-100, a high temperature ceramic material for hermetic seal applications is subject of data sheets. It bonds physically with stainless steel and is available in preforms and completed seals. Technical details are given. 4 pages. Consolidated Electrodynamics Corp.

Circle 660 on Page 19

Hard-Facing Alloys

Chemical composition, properties, typical applications, and application procedures for 11 Haynes hard-facing alloys are covered in booklet "Haynes Hard-facing Alloys—Bare Rods, Powder, Crushed Particles." Iron, cobalt, and nickel base alloys and cast tungsten carbide are included. 8 pages. Haynes Stellite Co.

Circle 661 on Page 19

Engines & Power Units

Horsepower and speed ratings of Golden Power line of engines and power units are content of Bulletin 1034C. Included are LP gas, natural gas, gasoline, and diesel units. Maximum brake horsepower at certain indicated speeds is given. 4 pages. Minneapolis-Moline Co.

Circle 662 on Page 19

Arbors & Chucks

Data for selection of interchangeable extension arbors and tapered shank collet chucks for internal grinding and milling spindles are found in illustrated Bulletin WA-10. Covered are 250 styles and sizes of arbors. Also described are self-removing wheel holders for various types of grinders. 30 pages. Pope Machinery Corp.

Circle 663 on Page 19

Resolver

Tuned impedance of 10,000 ohms which permits operation over a wide voltage range is feature of Size 15 resolver. Described in illustrated Bulletin 438, it has an accuracy within ±0.1 per cent from -55° to 85° C. Characteristics are given. 2 pages. Norden-Ketay Corp.

Circle 664 on Page 19

High Pressure Valve

Engineering drawings and engineering information on the Cash Standard Type 505 high pressure control valve are included in bulletin. Designed for 10,000-psi service, it provides close control of gases and liquids. Specifications of available types are given. A. W. Cash Co.

Circle 665 on Page 19

Centrifugal Fans

Engineering data on BC airfoil centrifugal fans are available in illustrated Bulletin 257. Construction details, capacity tables, dimensional drawings, and suggested application arrangements are among contents. 32 pages. Ilg Electric Ventilating Co.

Circle 666 on Page 19

Silicone Rubber Sheets

Properties of 50, 60, and 70 durometer hardness silicone rubber sheets and fabric-reinforced silicone rubber sheets are detailed on Bulletin SR-57. They are suited for applications from -85 to 500° F. 2 pages. Connecticut Hard Rubber Co.

Circle 667 on Page 19

Fasteners & Small Parts

Illustrated Catalog 106 covers design and use of such cold heated specialties as rivets, nails, screws, and other fasteners and small parts. Data includes cost and design advantages and manufacturing possibilities, plus information on metals and finishes. 16 pages. John Hassall, Inc.

Circle 668 on Page 19

Aircraft Hose Assembly

Springfield 120 Teflon aircraft hose assembly with Titeflex reusable fittings is described in illustrated aviation catalog supplement. Aircraft hose offers chemical resistance, inertness, and thermal stability. Specifications are given. 4 pages. Titeflex, Inc.

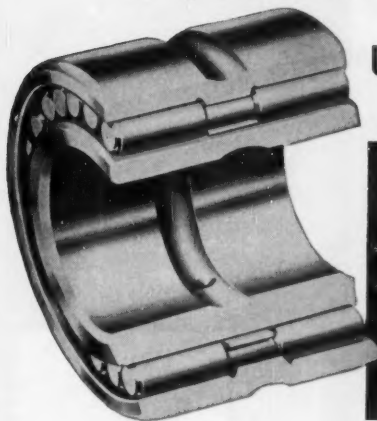

Circle 669 on Page 19

O-Rings

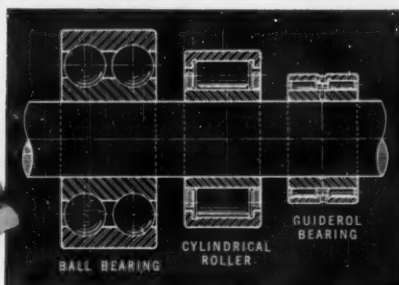

Range of industrial O-rings in standard sizes and compounds is described in illustrated Bulletin OR-57. It lists standard O-rings keyed to an SAE uniform numbering system. Compounds formulated for a broad range of uses, hardness ratings, and

BEARING TIPS by McGill

To pack more performance in smaller space

Use space-saving **McGILL GUIDEROL®** needle bearings

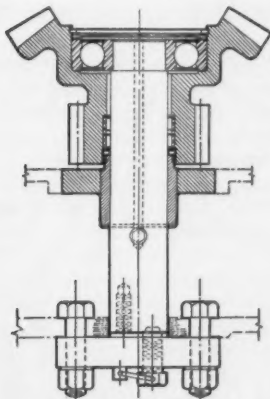

Showing graphically how a McGill GUIDEROL precision needle bearing permits more streamlined designing by supporting comparative loads in significantly smaller radial space than other types of bearings. Bulky and more costly housing space is easily avoided.

The McGill GUIDEROL Bearing combines the inherent high-load capacity of a full complement of full race width rollers with a center roller guiding principle that limits skewing and binding under misalignment. This qualifies the bearing for a whole range of applications that are too heavily loaded for a retainer-type bearing and are subject to the misalignment that precludes use of an ordinary needle bearing. For outstanding performance in small radial space, use GUIDEROL precision needle bearings. Specify the interchangeable sealed SGR series for added protection against contamination.

GUIDEROL® bearing capacity, space economy proved in power shovel vertical reversing shaft assembly

Baldwin - Lima - Hamilton Corp. uses a McGill GUIDEROL bearing, on $\frac{1}{2}$ cubic yard power

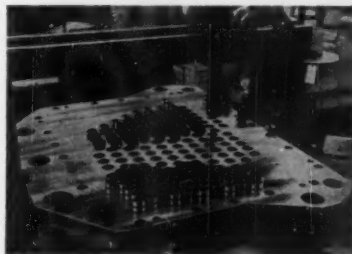

shovels, to carry spur pinion loads in the vertical reversing shaft. The

high capacity of the bearing in small radial space is an important factor in selection of this bearing. Only 3.75" in diameter, it has a load capacity of 28,560 lbs. at 100 rpm. In the power shovel application, it supports 14,150 lbs. at 76.3 rpm, which gives a high margin of safety. The center guided rollers also are especially adaptable to a vertical application such as this.

Fact-packed Bearing Catalog

Write for your copy of Catalog #52-A, a 128 page Bearing Selection Guide. It contains vital product information and 30 pages of engineering data.

Multiple spindle drill heads require support of spindles on very close centers

Crowding a great number of drill spindles into a small area, Zagar, Inc., of Cleveland has found the McGill GUIDEROL bearing construction especially suited to the needs of multiple drill head units. The full bearing width rollers provide rigidity and more than adequate load capacity and in a bearing only 1.25" in bore diameter.

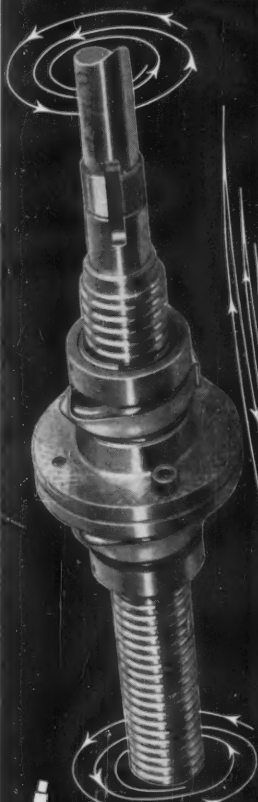

Insure performance with **McGILL®**

ROCKFORD

MORLIFE® Spring Loaded CLUTCHES Provide

MORE GRIP WITH

LESS SIZE

Because ROCKFORD Morlife Clutches handle double the amount of torque handled by ordinary friction clutches, they enable design engineers to reduce the effect of centrifugal force developed by modern, high-speed engines. By cutting down the required diameter of the clutch, they reduce weight. By insuring better heat disposal, they multiply the clutch's work-life. While your next model is in the planning stage, it will pay you to investigate how this new type clutch will improve the operation and eliminate 90% of the clutch service requirements of your product.

REFRASIL

2000°-3000° F.
High Temperature Insulation

...it may be the
special insulation
you've been
looking for!

REFRASIL PROPERTIES:

- Chemical resistance of pure silica
- Resists temperatures up to 3000°F. under certain conditions
- Low Thermal conductivity
- Fiber diameter .00020—.00040 in.
- Specific heat .19
- Thickness .14—.15 in.
- Surface density .05 lb./sq. ft.

REFRASIL USES:

- 2000°F. continuous high temp. insulation
- Filtration of corrosive materials
- Removable, insulating blankets
- REFRASIL and plastic laminates
- Thermocouple wire insulation
- Electric muffle furnaces
- Laboratory heating mantles

REFRASIL INSULATING BLANKETS:

"WRAP-AROUND"

"PRE-FORMED"

WHAT IS REFRASIL? REFRASIL is a highly efficient fibrous silica insulation material, extremely light in weight and bulk and made in a variety of physical forms.

REFRASIL has proven its high temperature insulation ability in millions of hours of jet aircraft operation. It is fast becoming an important industrial insulation for critical and extreme temperature applications from -300°F. cold to +3000°F. heat. Despite relatively high initial cost, REFRASIL is economical when restricted to special high temperature uses where ordinary insulation materials fail.

If you need an efficient, lightweight 2000°-3000° insulating material in bulk fiber or any of the physical forms shown, REFRASIL may be your best answer. For your *special* high temperature insulation problems, our research and development engineers are only a phone call away. Call or write for complete engineering information and free samples of REFRASIL, for your own testing.

Speed-Reducing Apparatus

makes any helical gear drive configuration

Line of helical-gear, speed-reducing units, called Moduline, provides basic subassemblies and accessories which combine to make any helical-gear drive configuration. New double-reduction cage has a fixed 5:1 set of low-speed gears. High-speed change gears are mounted on rolled spline shafts so that they can be mounted or replaced with hand tools. Gears in the triple and quadruple-reduction subassemblies are also spline mounted. Seven unit sizes to 30 hp are available with ratios of 5:1 to 625:1. Stand-

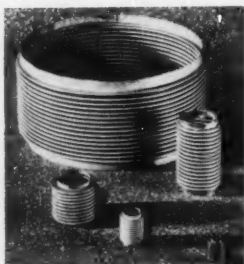

ard components can be assembled into arrangements to allow floor, ceiling, wall, or angle mounting. Addition of accessories provides for vertical flange mounting, right-angle input and output drives, gear motors, package motor reducers, and concentric-shaft speed reducers. Gear case and low-speed cage are shown. Westinghouse Electric Corp., Box 2278, Pittsburgh 30, Pa.

ADVERTISED IN
The Saturday Evening
POST

The TW series motor is available with 6 volt DC to 115 volt AC or DC performance winding. The horsepower range is 1/150 to 3/4, depending on the speed and type of duty required.

This motor is ideal for pumps, can openers, chair vibrators and actuators, blowers, hedge trimmers, and tape dispensers. Typical automotive applications are window and seat actuators, top lifts, evaporative coolers, and air-ride compressors.

Write, wire, or telephone either the Redmond office nearest you or the home office, and our sales engineer will show you how this motor can save money on your application.

for servo and
computer applications

Model T-750 concentric-shaft differential is a totally enclosed, dustproof unit for servo and computer applications. Output and inputs extend concentrically from one end of a servo-mounted case. This permits mounting of the differential in alignment with stand-

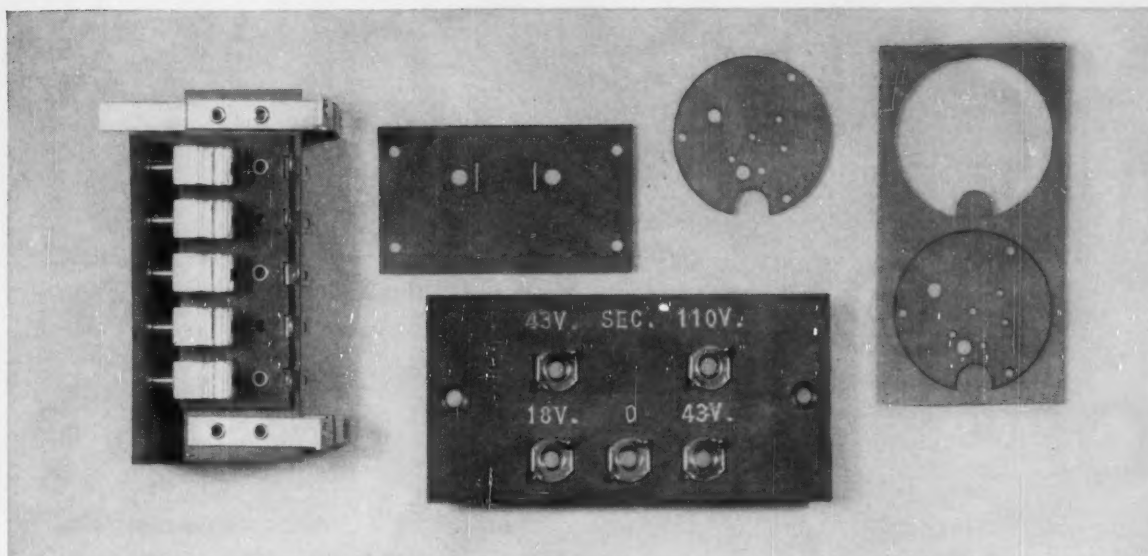

ard servo components, resulting in a single-line gear train. **Sterling Precision Corp., 34-17 Lawrence St., Flushing 54, N. Y.**

Silicon Solar Cells

provide energy for
many portable devices

Silicon solar battery cells convert light and radiant energy into electrical power of useful proportions. The p-n junction-type cells, when grouped in a series parallel configuration, become a primary pow-

LEADING MANUFACTURERS USE VULCOID. For a punched timer-switch part that operates in oil; for arc chutes in circuit breakers; for the insulation and structural part of an auto-headlight dimmer switch; for a formed electrical switch part carrying 110-volt 60-cycle current; for a

mass-produced, 110-volt light-socket part—for these and many more Underwriters-approved parts, CDF Vulcoid is an effective, economical insulation material—good where neither plain fibre nor plain phenolic laminate would suffice.

Fibre gives it high arc-resistance . . .
Aniline resin gives it moisture-resistance

CDF VULCOID

resin-impregnated vulcanized fibre

Vulcoid® is different. To the electrical properties of vulcanized fibre we've added the low moisture-absorption of an aniline-type resin with an unusual affinity for cellulose fibers—all at low cost. Excellent moisture-resistance (two to four times that of plain vulcanized fibre) helps stabilize Vulcoid's excellent electrical insulating characteristics. Its low cost makes Vulcoid a fine production material for applications of moderate electrical requirements.

Underwriters' approval. Vulcoid is approved by Underwriters' Laboratories as a material for the insulation of current-carrying parts in electrical equipment. It carries the distinctive red and blue thread marking of such materials.

Easy to work. Like vulcanized fibre, Vulcoid is readily drawn or formed into permanent shapes, punched, machined (see

illustration above) at low cost. CDF fabrication facilities can give you production quantities of Vulcoid parts to your specifications.

Learn all the advantages of designing around low-cost CDF Vulcoid parts such as arc-deflector spacers, transformer and motor lead bushings, circuit-breaker and transformer barriers, knife-switch guides, transformer coil separators, instrument and contact panels, baseboard receptacles, etc. Ask your CDF man or write for new technical bulletin.

Instant-Reversing Motors

have ratings from
1/6 through 1 hp

Energizing for reversal is instantaneous in Inst-O-Verse motors, because low-friction nylon shoes

This Rem-Cru titanium wheel, whirled at high speed, withstood more stress than the strongest steel.

How strong and tough is titanium?

Part of the answer is shown in a dramatic test, which may illustrate some of the characteristics you are looking for. An 18-pound jet compressor wheel of Rem-Cru C-130 AM titanium alloy was whirled at tremendous speeds. It withstood far more rpm's than the strongest steel. *In fact, this*

titanium wheel had to be notched before it would break at all.

If you're looking for a strong, tough metal, with light weight and exceptional corrosion resistance, Rem-Cru titanium is the answer. It's promptly available in the grades and sizes you want.

SPENCER Vacuum

Supplies the
"Muscle"
for this machine

Designers at W. S. Rockwell Co. had the problem of developing a machine which would pick up, move and deposit brass sheets of these specifications: weight — 880 lbs.; length — 24'; width — up to 42"; distance of movement — 4' 6".

It was decided that the most efficient method of pickup would be suction cup assemblies with vacuum. Obviously, the vacuum producer chosen must be extremely reliable and built to withstand continuous usage.

A 25 H.P., 4 bearing outboard type SPENCER unit rated at 435 CFM was selected to do the job.

Spencer will be glad to cooperate in designing and manufacturing vacuum producers or blowers to meet your special requirements.

Two Catalogs to Aid the Designer

"132 UNUSUAL USES OF SPENCER VACUUM"

Bulletin 144 illustrates and describes how Spencer Vacuum is used in industries from A to Z.

NEW

129 Hydraulic Pump and Motor Combinations

brand new bulletin ready!

Gives full performance data on pump and motor combinations.
Write today for your copy of Bulletin 810-A.

Here are power sources for any hydraulic application. Commercial, military, and aviation research have developed this array of standard pump and motor combinations.

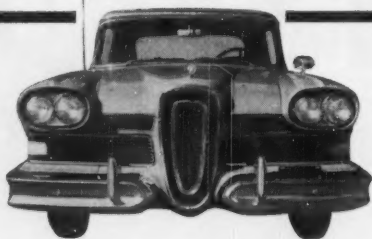

With a performance range from .1 to 5 G.P.M. at pressures to 2000 P.S.I., you can expect a stock power source that fits your requirements. Many types of motors offer a choice of electrical characteristics, and have drip-proof, totally enclosed, or explosion-proof enclosures as required.

Typical uses are hydraulic power for machine tools, automatic door openers, material handling equipment, and thousands of other applications requiring smooth, dependable hydraulic power.

When you need custom equipment, call on Eastern and discover how this adaptable line of hydraulic pumps and motors fills the bill without research expense by you.

How about Malleable?

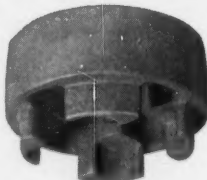

**The
1958
Edsel**

**America's Newest Automobile
includes Malleable Iron Castings
as important components**

Power steering housing

Universal joint flange

Transmission rear brake drum

Recognized for its durability and versatility for over 130 years, and used for parts in all kinds of transportation equipment, it's not surprising to find applications of standard and pearlitic Malleable castings throughout the Edsel.

The three Edsel parts examples illustrated are important uses of malleable. The power steering mechanism housing is certainly a place for safety insurance. The universal joint flange is a vital link in the power train. And the transmission rear brake drum helps complete the flow of engine power to the car's drive wheels.

It's very likely *your* product could be strengthened, lightened or improved by the use of malleable iron castings. And malleable's easy machinability speeds production and cuts costs. A helpful review of *all* malleable iron advantages is contained in our new publication "Value Analysis". Write for your copy — to the Malleable Founders' Society.

Consult a malleable foundry engineer at the drawing board stage.

High-Strength Metal

**can be cast in
all forms and shapes**

Almanite, which combines austenitic manganese steel and martensitic white irons, can be used in mining, construction, dredging, petroleum, power, foundry, and metalworking industries wherever high wear resistance and hardness are required. The metal can be cast readily in all forms and shapes. Structure is similar to heat-treated steel, and it possesses a better combination of hardness, strength, and resistance to impact than either austenitic manganese steel or martensitic white irons. Certain types of the new metal have tensile strengths of 90,000 psi with ductility approximately 15 per cent. **Meehanite Metal Corp.**, 714 North Ave., New Rochelle, N. Y.

Another NEW CLARE PLANT to give you relays of unequaled quality

- Telephone type relays (ac and dc)
- Hermetically sealed relays
- Computer relays
- Video relays
- Power relays
- Mercury-wetted contact relays
- Relay banks
- Plate circuit relays
- Stepping switches
- Lever, push and turn keys
- Other special relays

New C. P. Clare & Co. plant at Fairview, N. C. will expand manufacturing facilities which have been under way in Fairview for two years.

Before midyear 1958 CLARE will be serving customers from a new factory at Fairview, N. C.—a facility that will match the manufacturing advantages of our Chicago plant, itself only five years old.

This CLARE expansion is made necessary by the tremendous growth of the electronics industry and the increasing demand for precise components, including relays whose life can be measured in billions of operations.

Facilities of virtually clinical cleanliness are required for this kind of precision. That's why CLARE plants in both

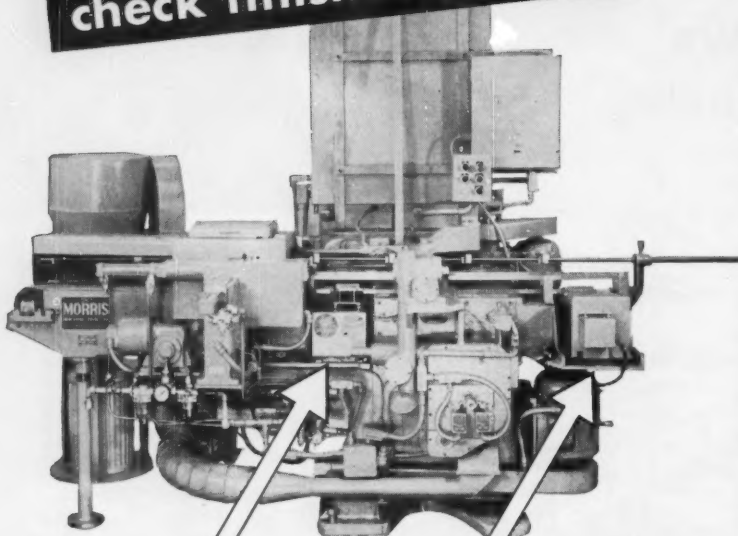

Chicago and Fairview maintain complete control of the temperature, humidity and cleanliness of the air... immaculate walls and floors... powerful, shadowless lights, for assembly of small parts.

If yours is a product whose long life, reliable performance and freedom from maintenance depends on relays, it will pay you to know ALL about CLARE relays. C. P. Clare & Co., 3101 Pratt Blvd., Chicago 45, Illinois. In Canada: C. P. Clare Canada Ltd., 2700 Jane Street, Toronto 15, Ontario. Cable Address: CLARELAY

CLARE RELAYS

FIRST in the industrial field

Built-in SCALES pre-set machine and check finished product

PRE-SET BY EXACT WEIGHT

In MORRIS PISTON MILLING MACHINE, scale No. 1 determines amount of overweight that must be removed to balance pistons. Linkage transfers reading to depth of cut and sets machine for milling off the correct amount of excess pad.

INSPECTED BY EXACT WEIGHT

After milling, piston travels to the second scale where it is checked against predetermined weight. The SHADOGRAPH scale is adjusted to one gram, plus or minus. Should final check show over or under this amount, machine is automatically stopped.

The above application shows how EXACT WEIGHT precision designed scales can be fitted into modern machine tooling to bring your operations a step nearer automation.

If you are now designing machines or products that require accurately controlled weight as a part of their manufacture, investigate our SHADOGRAPH Scale application. These scales can be easily built into most modern production machines. Their absolute accuracy adapts itself to complete electronic application and control.

Complete engineering data is available for designers. Write, giving your specific application.

Captive Fastener

for use on electronic subassemblies

New captive fastener, adapted for use on electronic subassemblies, consists of a swaged-in-place sleeve, a bolt with both threaded shoulder and shaft, and a small spring. Two threads at the top of the sleeve accommodate the threaded shoulder of the bolt. Two turns of the bolt carry it through the threads to become captive within the sleeve, held in place by

TENSION-TO KEEP YOUR BOLTED ASSEMBLIES TIGHTER LONGER

RELiance SPRING LOCK WASHERS

Wherever products are subject to movement, vibration, stresses and strains, more than tight fastenings are necessary to keep assemblies tight indefinitely. There must be constant tension in the assemblies and the one sure way to accomplish this is by the use of famous Reliance Spring Lock Washers. They not only retard "nut creep," but automatically compensate for bolt stretch, thread wear, expansion and contraction due to temperature changes.

Made of cold drawn spring steel in Reliance's own cold finished mill, the

Spring Lock Washers are quality controlled throughout their manufacture and offer the reactive range and pressure necessary to keep bolted assemblies tighter longer. Reliance Spring Lock Washers have proved for fifty years an accepted standard in industry, and are produced in four standard series: light, medium, heavy and extra heavy for each screw and bolt size.

For more information please write for Engineering Bulletin W-50 or request a visit from one of our fastening engineers.

**for chemical and
electrical applications**

Polyenco thin-wall Teflon tubing is available in 11 sizes from 1/8 to 1 in. ID. Nominal wall thicknesses are .030 in. on sizes through 5/8 in., .040 in. on 3/4-in. size, .045 in. on 7/8-in. size, and .050 in. on 1-in. size. All sizes are available in ten coded colors for circuit identification.

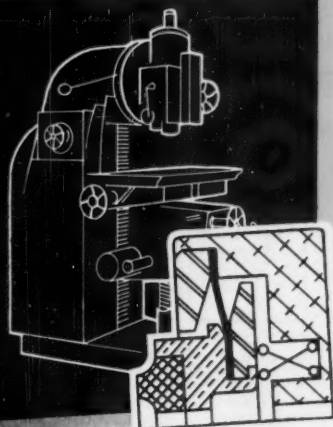

Machine Tools And Power Transmission Equipment

STYLE GU — A packaged sealing unit containing both rotating and stationary seal faces enclosed in metal housing. Stock sizes for shafts .250 through 4.000.

Pumps And Compressors

ROTO-FLEX — Rugged flexibility. Only 3 parts. Single or double units. Stock sizes for shafts .250 through 4.000.
STYLE RFO — A specially designed Roto-flex seal, for installation outside the stuffing box. Stock sizes for shafts .250 through 4.000.

Heavy Machine Tools

STYLE DPC — A high-speed, carbon-faced seal, for more compact installation in heavy industrial machinery. Stock sizes for shafts .250 through 4.000.

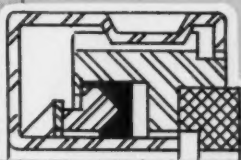

A Complete Line **GITS SHAFT SEALS** For Every Application

These modern, mechanical, face-type seals are carried in stock — to save you time and money. Write for detailed data.

Specialists In Lubricating Devices And
Shaft Seals For Almost Half-A-Century

Aircraft Engines And Accessories

STYLE HH — Absolute minimal space (both radial and axial) under extreme conditions of temperature, pressure and seal face surface speed. Features pressure balance when fluid pressure is applied internally or externally. Stock sizes for shafts .250 through 4.000.

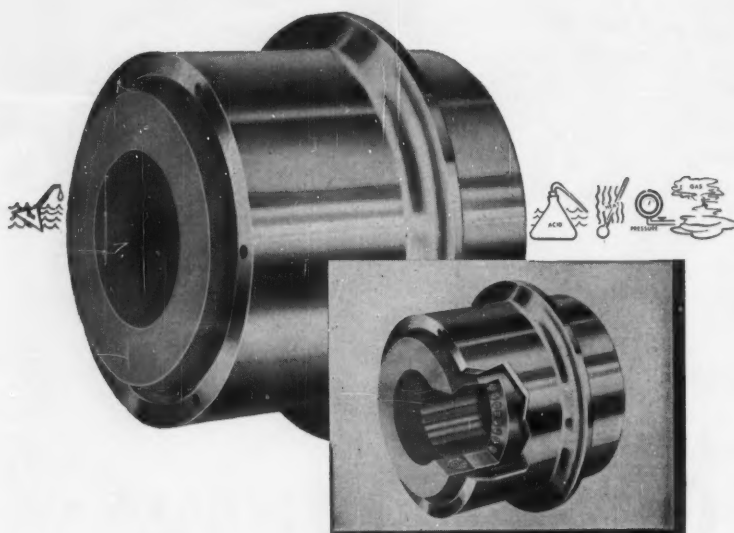

Household Appliances

STYLE SGU — A factory-assembled unit-type seal for the small-budget user. Stock sizes for shafts .250 through 1.000.

SPECIAL

nothing can touch this winding

Oil, acid, vapor, heat and pressure don't affect this AC motor winding. It's completely encased in a special, high-temperature, chemical-resistant plastic. The windings are cast right in the plastic to make a single, solid, impervious piece.

Of course, this winding goes into a special motor — one that's designed to run in a pressurized atmosphere of inert gas, under constant exposure to a piping-hot oil splash and vapor at over 200°F. Temperature-stabilized bearings, oil lubricated under pressure, and drip-proof, corrosion-resistant construction are some other design necessities for this unique 115-volt, 1/3 hp AC motor.

Here is a typical example of ESCO's unusual ability to design and build rotary electrical equipment to meet special customer needs. Whether or not your particular motor problem is this special, remember that ESCO's twenty years of broad experience is always available to you. No motor or generator problem is too big or small, too routine or specialized for ESCO engineers and craftsmen to solve properly, the way you want it solved.

Refer to Esco Catalog in section ^{4a}/_{El} in Sweet's Product Design File, or write direct for general catalog No. 56PD. Why not also send us details on your special problem . . . we'll be glad to show you how we would go about solving it for you.

tification. Uses include chemical and food-processing lines. Tubing has excellent dielectric properties for use for wire bundling or sleeving insulation. It resists soldering heats, has high flex life, and low and high-frequency insulating properties are virtually unaffected by moisture or heat to 500 F. **Polymer Corp. of Pennsylvania**, 2140 Fairmont Ave., Reading, Pa.

Circle 707 on Page 19

Printed-Circuit Contacts

have high
flexing strength

Swingflex contacts, which have high flexing strength and positive area contact, are for use with printed-circuit boards 1/16 and 3/32 in. thick. They are for either single or double-sided board connection. Design eliminates the possibility of damage to contact or printed-circuit board during assembly or multiple insertion. Contacts are pretempered beryllium copper, available in solder-eye (shown), taper-tab, solder-dip, and wire-wrap terminations. **H. H. Buggie Inc.**, Box 817, Toledo 1, Ohio.

cooling installations

Model 1733-HBU-249 coolant pump is a self-priming, positive-displacement unit with an externally adjustable pressure-regulating valve. It is for use in supersonic, high-altitude flight and meets military

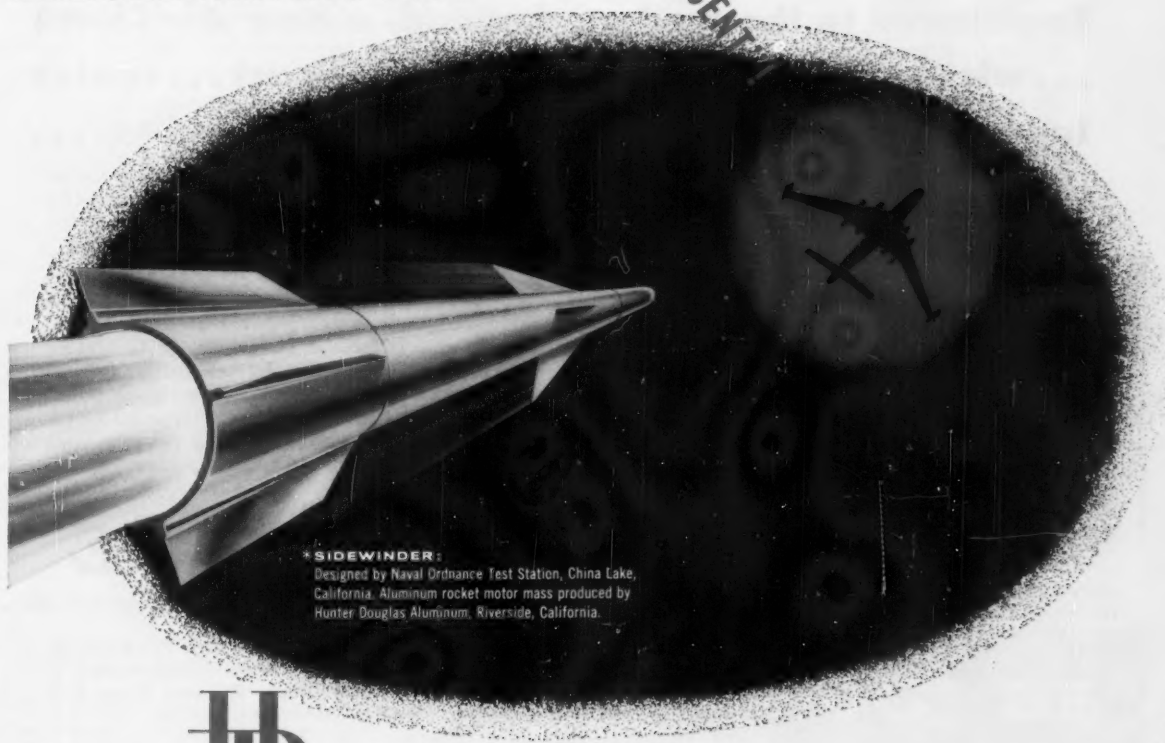

THE SKY TUBE THAT STAYS HOT ON A HEAT "SCENT"

In the skies today flies a new series of deadly, pilotless rockets...lethal in their sting, unerring in their flight. Infrared control solved the major problem of guidance but mass production of the rocket with economy was still a difficult assignment. Here, Hunter Douglas aluminum cold forgings proved uniquely successful.

This process achieves fast, economical production of tubular shapes with a variety of internal and external structural details integral with the tube itself. Costly fabrication and time-wasting assemblies are eliminated. The resulting tubes are *stronger, simpler, cheaper, more accurate and more efficient!* Combine these advantages with *straightness, roundness and true diameter* from end to end and you'll see why Hunter Douglas is the recognized source for cold forged tubular components from coast to coast.

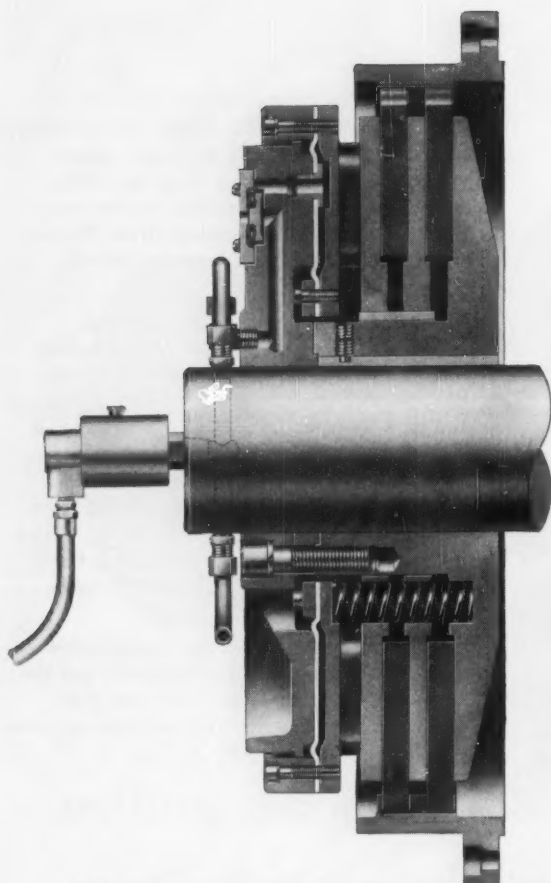

If your contract includes tubular or hollow shapes—with or without closed ends—get the facts on Hunter Douglas Aluminum Cold Forgings. A letter will bring recommendations.

ANOTHER HUNTER DOUGLAS "FIRST"—Newest member of the special metals family to undergo successful cold forging at Hunter Douglas is Molybdenum—now produced experimentally in precision tubes of nominal length. Not a standard production item; cost necessarily restricts Moly tubes to vital projects, at present.

***SIDEWINDER:**

DODGE *AIR-GRIP* CLUTCH

**Engineered to the modern demand, a New Air Clutch
...with amazing sensitivity...compact...cooler
in operation...built-in quick release valves...**

Finger tips on the throttle bring instant response, give the operator split-second control. This new product of Dodge is the quickest-acting air clutch available!

New design and engineering by Dodge achieve this exceptional control—in a clutch that provides maximum torque capacity in minimum space. Less air is used to operate the clutch—the result is a new sensitivity that enables the operator to “inch” the clutch, or to throw it into full engagement as required. Where instant disengagement is needed, quick release valves are built into the clutch itself, as optional equipment.

The unique design of the Air-Grip Clutch places the air seal disc at the end *farthest* from the pressure plates, which generate the heat inherent in clutch operation. This, combined with automatic internal ventilation, insures

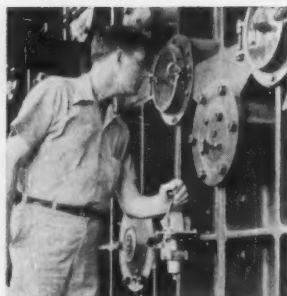

cooler operation and longer life under severest service. Provision is made for mechanical engagement of the clutch if the air supply should fail.

Thorough tests in the field as well as in the laboratory assure you of Dodge dependability in the Air-Grip Clutch. Available in sizes from 8.5 to 460 hp at 100 rpm at 80 psi. Call your local Dodge Distributor or write for Bulletin A634.

Miniature Potentiometers

dissipate 2 w at 60 C

Microminiature precision wire-wound potentiometers known as Acesets, are available in nine resistance values between 100 and 25,000 ohms. They offer high stability under temperature cycling, and dissipate 2 w at 60 C. Units

incorporate a one-piece, precision-machined metal case, passivated stainless-steel shaft, and self-contained locking device. Resistance tolerance is ± 10 per cent. **Ace Electronics Associates Inc.**, 99 Dover St., Somerville, Mass.

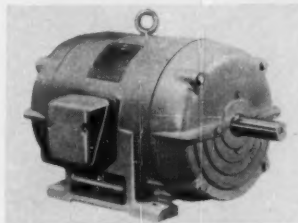

Circle 710 on Page 19

Induction Motor

compact ac unit is for synchronous applications

Synco-Spede synchronous induction motor is built in the same NEMA frame size as a standard motor of equal horsepower. It ac-

celerates as an induction motor, but runs at exact synchronous speed without permanent magnets or dc excitation. A compact ac unit, it offers high power factor and efficiency, and is suitable for use on many applications requiring constant speed with varying load. Since it is unaffected by voltage fluctuations, it is suitable for precision timing and metering devices and for recording instru-

ments. Unit is available in ratings from 1 to 100 hp in any enclosure, and can be foot or flange mounted. **Louis Allis Co.**, Dept. P, 427 E. Stewart St., Milwaukee 1, Wis.

Circle 711 on Page 19

Ceramoplastic

resists temperatures to 1600 F

Supramica 560 is formulated from synthetic mica, which increases the temperature resistance of the ceramoplastic. It can be used for applications requiring excellent insulating properties and continuous operation at temperatures to 950 F. Material retains its structural characteristics at temperatures as high as 1600 F. **Mycalex Corp.** of America, Clifton Blvd., Clifton, N. J.

There's a G-E **TRI 55 CLAD** motor for

REG. U.S. PAT. OFF.

FOUR BASIC

STANDARD ENCLOSED NON-VENTILATED Tri/Clad '55' motors are designed in 1 and 1½ horsepower ratings for operation under most outdoor conditions and in industrial atmospheres containing metallic dust, dirt and moisture. As all Tri/Clad '55' enclosed motors, these motors have rigid cast-iron frames and end-shields. Rabbit fits are moisture sealed for even greater motor protection.

your toughest applications!

General Electric announces new severe-duty enclosed motors in ratings from 1 to 5 horsepower, giving you a more complete line of Tri/Clad '55' enclosed motors to choose from.

Whether you need a standard enclosed, severe-duty, or explosion-proof motor, General Electric has the rating you need. From G.E.'s complete line—the most complete in the industry—you are better assured of getting the "right" motor for your toughest applications.

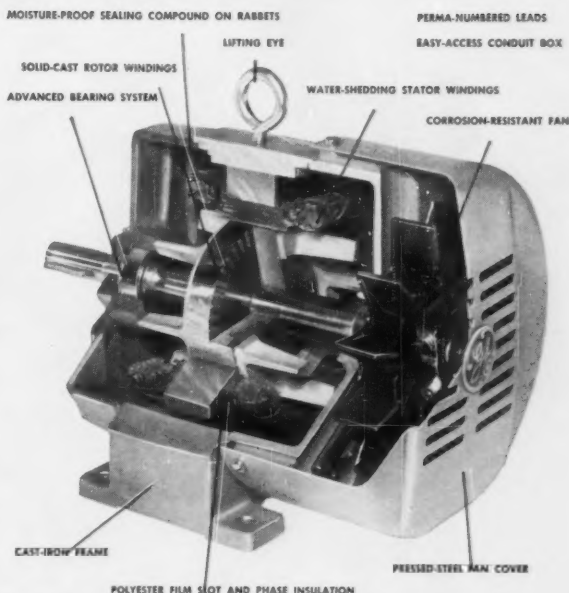

Of course, G-E enclosed motors offer you all the outstanding features of the Tri/Clad '55' line including Mylar* polyester film insulation for longer life, minimum maintenance; non-wicking leads and silicone stator coating for maximum moisture protection; Formex† magnet wire for greater protection against heat-aging and abrasive dust; and many, many more.

Because they're built for better protection, longer life, easier installation and minimum maintenance: G-E Tri/Clad '55' *totally* enclosed motors are your best buy.

For more information on the "right" motor for your applications, contact your G-E Apparatus Sales Office or Distributor. Or, write to Section 840-8, General Electric Company, Schenectady, N. Y. for bulletins GEA-5980 and GEA-6341. For enclosed motors above 5 hp, ask for GEA-6602.

†Registered Trade-mark of the General Electric Co.

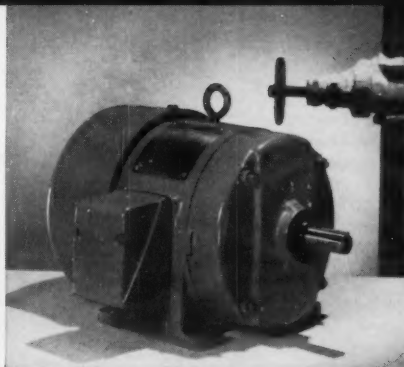

Standard enclosed fan-cooled Tri/Clad '55' motor.

GENERAL ELECTRIC

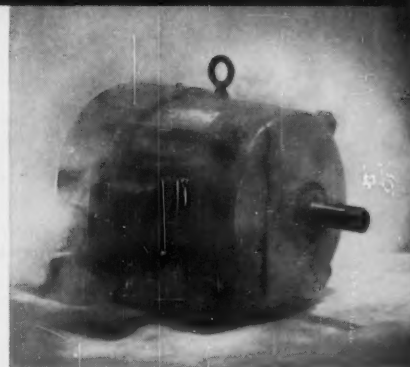

TRI 55 CLAD ENCLOSED MOTORS AND WHERE TO USE THEM

STANDARD ENCLOSED FAN-COOLED Tri/Clad '55' motors, designed for operation under the same conditions specified for the standard enclosed non-ventilated motors, are available in ratings from 2 to 5 horsepower. Features include rugged, pressed-steel fan cover; non-sparking fan; and pressed-steel conduit box with keyhole slots for all-position mounting.

SEVERE-DUTY ENCLOSED Tri/Clad '55' motors are available in both fan-cooled and non-ventilated designs for applications in chemical atmospheres and other areas in which highly corrosive or excessively moist conditions are encountered. Available in ratings from 1 through 5 horsepower, General Electric severe-duty motors feature all cast-iron construction, external neoprene slinger, and complete gasketing for greater motor protection.

EXPLOSION-PROOF Tri/Clad '55' motors are designed for safer operation in atmospheres containing gases or dust which threaten explosion or serious damage in the event of an electrical spark. G-E explosion-proof motors are U. L. listed, and each feature a non-sparking fan; long, close rabbit fits; sealed lead entrance; and dust-tight labyrinth shaft seal.

Photoelectric Scanners

miniature units are operated by very small objects

Miniature photoelectric scanners provide whole-light-beam interruption by 1/32 in. diam objects, moving at a fast rate. Heads can be installed in a space 2 to 12 in. apart. Photocell responds to reflected and direct light. Light source operates on 6.3 v, and beam has adjustable focus for sharp defi-

WHERE POWER CONTROL COUNTS MOST...

...you'll find

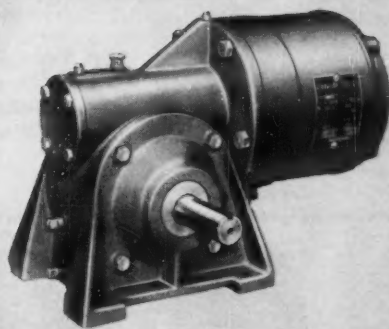

Janette

When perfect power control is essential, engineers specify Janette gear motors, speed reducers, and variable speed control drives, because they are integral units—motor and gears are designed for each other—then built by one company to assure perfect reliability, extra long, trouble-free life.

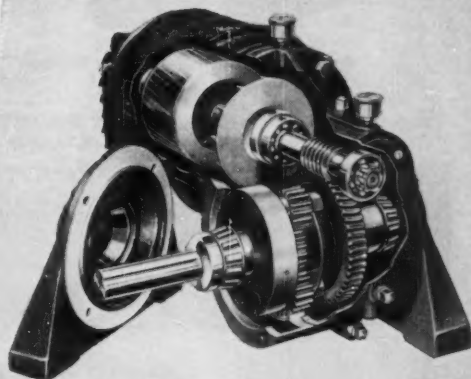

Regardless of the product, Janette has the right speed at the right power for your particular application from 1/150 to 7½ horsepower, in a wide variety of models and in any mounting position. And when your problem demands original research and custom design, you can draw on the nearly 50 years of Janette engineering experience and know-how.

Silicone News

FOR DESIGN ENGINEERS No. 45

New "Shape-it-yourself" Silastic Vulkanizes at Room Temperature

A new, room temperature vulcanizing silicone rubber with excellent handling characteristics and durability is now available from Dow Corning.

The new rubber, Silastic® RTV 501, stays rubbery from -70 to 500°F and has exceptional resistance to moisture and weather. These and the other properties shown below make Silastic RTV 501 ideal for encapsulating electric and electronic assemblies and for general potting, sealing and calking applications.

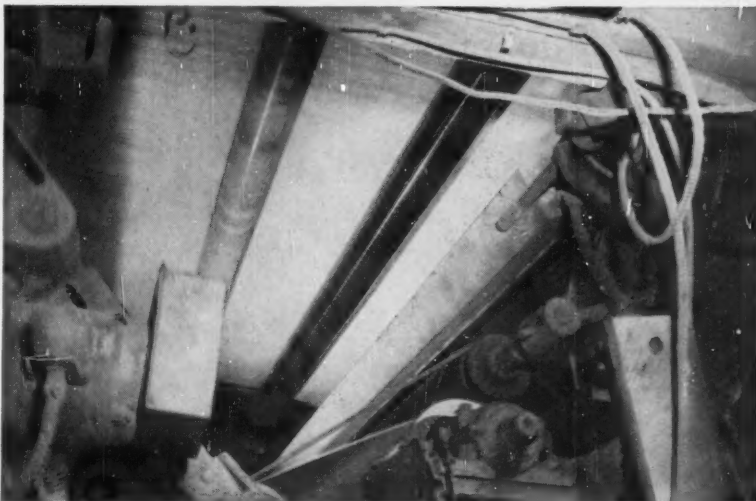

Easy to process, the new silicone rubber has a long shelf life and mixes easily with the recommended catalyst. The two ingredients can be blended either manually or mechanically as long as three hours before being used. Both the fluid polymer and catalyst have a viscosity of approximately 60,000 centistokes. Silastic RTV 501 cures at room temperatures within 24 hours and attains maximum physical properties in only 2 to 3 days.

No. 456

Typical Properties of Silastic RTV 501

Serviceable temperature range	-----	-70 to 500°F
Electric strength, volts/mil	300 to 500
Dielectric constant, 10 ² cycles per second	2.6
Dissipation factor, 10 ² cycles per second	0.01
Water absorption after 70 hours at 212 F, percent	Nil

SILICONE ADHESIVES AID DEVELOPMENT OF PRESSURE-SENSITIVE TEFLON TAPES

With the aid of Dow Corning 274 Adhesive, the first pressure-sensitive adhesive ever developed that will stick to Teflon, Minnesota Mining has introduced a new Teflon-coated "Scotch" brand tape with a wide field of potential applications.

Applied to main carrying rollers on machines making heavily sized papers, for example, this new 3M tape promises to eliminate one of the "stickiest" problems in the paper industry. Sizing accumulates on these rolls so rapidly that repeated shut-

downs are necessary to clean them before the paper is ruined, or before the build-up hardens and must be chiseled off.

Now, however, by simply half-lap wrapping the steel rollers with the new Teflon-silicone adhesive tape, the sizing is repelled and maintenance costs reduced.

The effectiveness of this wrapping, which adds only 3 to 6 mils thickness, is demonstrated in the photo above. Note how the lead carrying roller on the right, wrapped with tape a year ago, is still as clean as a whistle. In contrast, the steel-surface roller is almost completely covered with sizing even though it occupies a less vulnerable position in the line-up.

Coating the steel rollers directly with Teflon would produce a similar effect but at a prohibitive cost. The 3M tape is so economical that in some cases it has paid for itself in a single day's run!

Facts about Dow Corning silicone adhesives: Because of their semi-inorganic nature, silicone adhesives have many unusual properties. Pressure-sensitive tapes based on them stick to almost anything including wet surfaces. Silicone adhesives possess good strength, are superb electrical

(Cont. Pg. 2)

ALL-NEW REFERENCE GUIDE TO SILICONE PRODUCTS NOW AVAILABLE

Most complete reference guide to silicones ever produced, describes Dow Corning silicone products now available in commercial quantities: fluids, lubricants, resins, adhesives, varnishes, dielectrics, rubber, water repellents, textile finishes, leather treatments, and other specialized forms.

Its 16 pages are filled with data and illustrations suggesting ways in which you can cut costs, simplify designs, improve performance and add new sales appeal to your

products with Dow Corning Silicones.

Cross-indexed for handy reference, this all-new 1958 Guide includes properties and uses for the many new silicone products developed in recent months. A "must" for every design reference file, you can obtain your Free Copy by circling . . . No. 457

EAGLE

Microflex reset counter

makes shutdown and feed-down automatic

Convert machine tool and industrial processes from manual to automatic operation — with this Microflex Reset Counter. For example, use it to feed a grinding wheel down after a preset number of operations. Or employ it to shut down a machine at the desired number of operations. This reset counter is ideal for controlling chemical feeding processes by shutting down a pump after the desired number of operations.

The Microflex Reset Counter is actuated by a series of electrical impulses. Models are available with 400 and 1000 count dials. Dial settings easy to make — counting range from 1 to 400 in steps of 1 with 100% accuracy. On 1000 count range, dial settings are in steps of 1 with accuracy of ± 1 count. Spring reset in less than $\frac{3}{4}$ second on full scale setting.

New Republic

REPUBLIC NYLOK NUTS offer advantages similar to those of Nylok bolts. They can be assembled from either end with hand or power tools, and lock tight wherever wrenching stops. Holding power is not affected by vibration. "Plastic memory" of nylon pellet gives Nylok nuts excellent adjustment and re-usability characteristics.

REPUBLIC

World's Widest Range of Standard Steels

Self-Locking Nylok Bolts

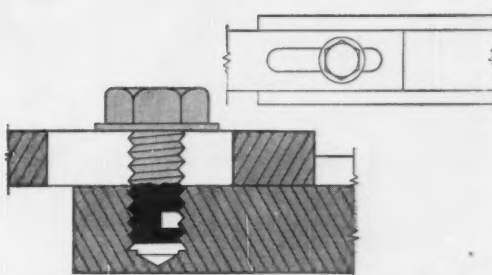

Provide Single-Unit Answer to Vibration, Liquid-Sealing and Adjustment Problems

If your bolted assembly must be vibration-proof, liquid-tight or adjustable—Republic Self-Locking Nylok® Bolts are your best fastener selection. You simply align parts to be fastened and turn Nylok bolt into threaded hole. A positive lock is provided, whether or not the unit is seated.

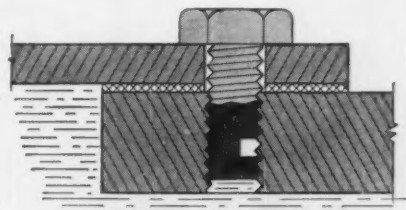

In addition, use of Nylok bolts eliminates lost motion of assembling extra locking devices or expensive wiring. They can be hand wrenched or power driven to minimize fastening time—a tremendous asset in high-volume production runs.

Locking is accomplished by means of a permanent nylon insert in the body of the bolt. This pellet wedges opposite mating threads together to form a vibration-proof lock. There is no damage to threads or seating surfaces, and the insert's resiliency allows fasteners to be adjusted and re-used repeatedly. Further, when properly seated, the nylon insert effectively blocks fluid flow around the helix of the threads. Even relatively soft materials can be locked to a threaded member using Nylok bolts.

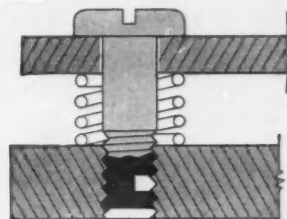

When you specify Republic Nylok Bolts you secure the double protection of Nylok locking plus Republic quality, built into each fastener from raw ore to finished product. To find out how you can take full advantage of this ideal combination, contact your Republic representative. Or mail the coupon for further information.

ADJUSTMENT problems like this movable plate are readily solved using Nylok bolts. The nylon pellet allows bolt to be backed off and wrenched tight time after time, without damage to threads, seating surfaces or holding power. Unaffected by age, immune to fungus, pellet won't dry out or shrink.

LIQUID SEALING properties of the Nylok bolt are demonstrated here. Nylon pellet, seeking to regain its original shape, effectively interrupts space between non-loadbearing surfaces of mating threads. Escape of fluid along helical thread path is blocked. Nylon's resistance to moisture and ordinary solvents assures permanence of seal.

VIBRATION has no effect on the locking characteristics of Nylok bolts, even when not wrenched tight as shown here. Secure grip is provided by nylon pellet permanently imbedded in fastener body. Continual pressure of resilient nylon forces tight metal-to-metal lock between mating threads opposite the pellet.

Why LINK-BELT geared flexible couplings can

transmit more hp per coupling dollar

**Size for size, they
accommodate larger
shafts ... transmit
more power than other
comparable couplings**

LINK-BELT geared flexible couplings offer an ideal combination of compactness, performance and low cost. They're designed for high load capacity, yet cost less because they are smaller.

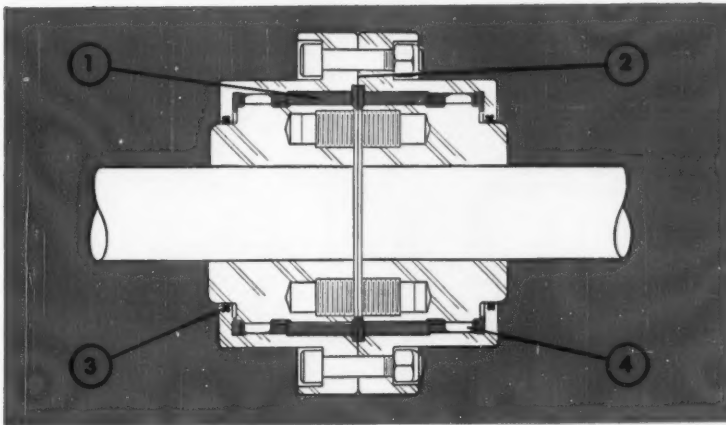

Hardened steel socket head flange bolts—ground for close fit—are the key to compactness. They permit a smaller flange. Thus, more of the coupling diameter is devoted to the gear and a larger hub which can be bored to accommodate larger shafts.

In a great variety of coupling applications—including those where shock, vibration, reversing loads and misalignment are encountered—these couplings can be used effectively to assure long life and minimum maintenance. Popular sizes are available with finished bores, packaged and ready for installation. For complete details, contact your nearby Link-Belt office. Or write for your copy of Folder 2775.

LINK-BELT

GEARED FLEXIBLE COUPLINGS

2-piece housing design assures efficient sealing and lubrication

- 1.** In operation, the lubricant centrifuges to the working gear surfaces at the perimeter of inside cavity. Lubricant can't escape.
- 2.** Fiber gasket fits tightly between flanges. Lubricant can't escape.
- 3.** Hub seal is smaller in diameter than gear teeth and running level of lubricant. No leakage is possible—dirt and water stay out.
- 4.** Mating gear teeth are constantly lubricated, preventing wear and providing long, trouble-free operation.

14-484-A

MICRO-BEARING ABSTRACTS

by A. N. DANIELS, President
New Hampshire Ball Bearings, Inc.

DYNAMIC AND STATIC LOAD RATINGS

Load ratings of MICRO bearings are based on standards established by the Anti-Friction Bearing Manufacturers Association and are the result of extensive tests.

The "life" of an individual bearing is defined as the number of revolutions the bearing makes before the first evidence of fatigue develops. Fatigue, in turn, is a function of bearing load and although other factors, such as contamination and high temperature, affect the life of a bearing, it is assumed that clean bearings running at normal temperatures are being considered.

It is not possible to predict the life of any individual bearing. The problem, therefore, is best approached by a consideration of empirically derived dispersion curves which provide a means of determining bearing life on a probability basis. That is, they permit the average life of a given group of bearings to be accurately specified.

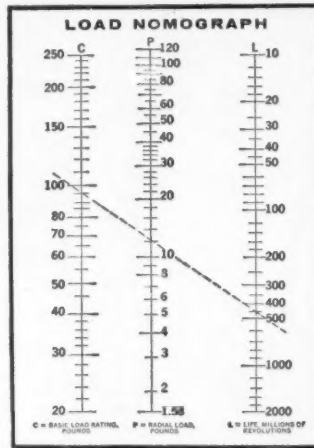

For purposes of standardization, the "rating life" of a group of apparently identical ball bearings is defined as the number of revolutions that 90% of the group will complete or exceed before the first evidence of fatigue develops. This figure is approximately one-fifth of the average life.

If two groups of similar bearings are run under different loads F_1 and F_2 within normal operating range of loading and rpm, their lives L_1 and L_2 are inversely proportional to the cubes of the loads, i.e., The BASIC LOAD RATING C is that radial load which a group of apparently identical bearings can endure for a rating life of one million revolutions, with stationary load and rotating inner ring. Within normal operating ranges, rating life for any load is a constant number of revolutions, so the following relationship, a restatement of the inverse cube proportion, may be used to compute rating life when basic load rating and applied radial load are known:

$$L = \left(\frac{C}{P}\right)^3$$

L =rating life in millions of revolutions
where, C =basic load rating in pounds
 P =applied radial load in pounds

The nomograph illustrated permits the quick evaluation of any one of the three quantities when the other two are known. For example, if the C rating of a given bearing is 95 pounds, and the bearing is loaded radially with

12 pounds, P , a straight edge crossing these two values in their respective columns shows that the bearing could be expected to have a life, L , of 450 million revolutions.

"EQUIVALENT LOAD"

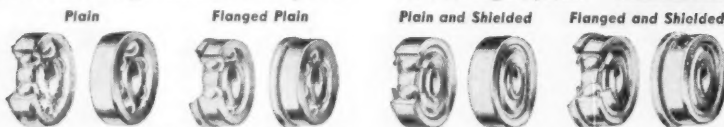

Bearings whose loads are primarily radial are usually also subjected to axial forces. When the axial component of the load is greater than a negligible value, this combined radial and thrust load may be expressed in terms of a simple radial load in order that the basic load rating C may be calculated. This simple radial load is known as the "equivalent load", which is that constant stationary radial load which, if applied to a rotating inner ring, would give the same life as that which the bearing will attain under the actual conditions of load and rotation.

A formula for determining "equivalent load" and a more comprehensive discussion of static and dynamic loads is found in our design handbook.

Snap-Action Switch

has one-way action
on two poles

ES4-DM3 die-cast switch provides simultaneous, one-way action on two poles, resulting in an electrical impulse on the inward stroke, but not on the return to normal position. Snap action of the four-circuit switch mechanism is totally independent of the speed of the plunger movement. The double-pole, double-throw switch is housed in an aluminum die-cast case with splashproof neoprene boot

Steel-Weld

FABRICATION

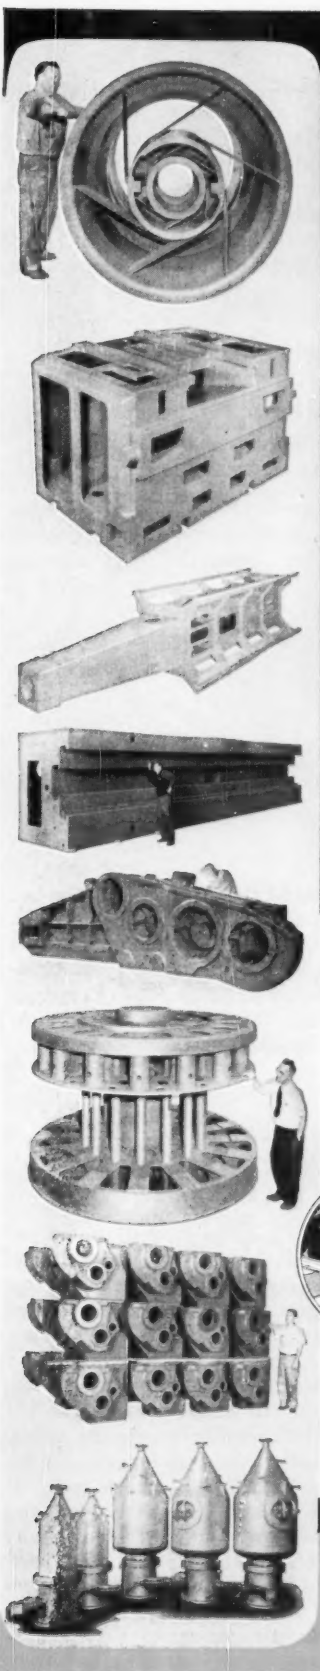

Use WELDED STEEL
for Greater Strength
with Less Weight!

The weldment shown above is the frame for a sixteen cylinder Diesel Engine designed for a potential of 5000 H.P. This precision piece, and those illustrated at the left are typical of thousands of Steel-Weld Fabricated parts and assemblies produced by Mahon each year for manufacturers of processing machinery, machine tools, and other types of heavy mechanical equipment. If you are not now taking full advantage of the economies offered by welded steel components in your product, you should give the matter serious thought. In the design of almost any type of heavy machinery there are parts and sub-assemblies that can be produced more economically, more satisfactorily, and in less time, in welded steel. In weldments you get greater strength with less weight—plus the additional advantages of greater rigidity and 100% predictability. When you consider weldments, you will want to discuss your requirements with Mahon engineers, because, in the Mahon organization you will find a unique source for weldments or welded steel in any form . . . a fully responsible source with complete facilities for design engineering, fabricating, machining and assembling . . . a source where design skill is backed up by craftsmanship which assures you a finer appearing product embodying every advantage of Steel-Weld Fabrication. See Sweet's Product Design File for information, or have a Mahon sales engineer call at your convenience.

New trends and developments in designing electrical products . . .

General Electric permanent magnet outperforms wire-wound field in D-C tachometer generator

Improved Alnico 6 magnet increases reliability and accuracy over wide ambient temperature range.

Instruments can determine rotational speeds from 100 to 5000 rpm with an error of less than .05%—despite ambient temperatures of 20° to 50° C. Problem is that these instruments are only as accurate as the tachometer generators that supply their power.

Conventional generators use copper windings. This means they are dependent on external—and often varying—power sources. They are adversely affected by wide temperature changes. And, they are costly to repair when windings burn out.

The 46-frame D-C generator, above, gets around these difficulties by using a G-E Alnico 6 permanent magnet. Here's why:

1. The G-E Alnico magnet does not depend on outside excitation.
2. It supplies reliably constant power.
3. Exposure to varying ambient temperatures does not affect the magnet's power or dependability.
4. External regulating equipment—needed with wire-wound fields—is eliminated by the use of Alnico magnets.
5. Unlike copper windings, permanent magnets never wear out.

These advantages, in themselves, were enough to make the magnet-powered generator a success.

However, with conventional Alnico 6, plastic-steel was needed between the "as-cast" surfaces of the magnet and the machined parts of the generator to cut eddy current losses, and to shield the flux. This added to the time and cost of producing the generator; made it almost impossible to disassemble for normal servicing and maintenance.

So G-E magnet engineers increased the coercive force of the Alnico 6 magnet by about 7%. The need for the plastic-steel "mud" was eliminated . . . and so were the difficulties of assembly and disassembly.

This generator is just one of the many applications where G-E magnets can outperform wire-wound fields for accuracy and reliability. And the work of G-E Magnet Engineers in improving Alnico 6 is just one of the many services they offer to designers and manufacturers of electrical products.

For more information about G-E magnet engineering services, or for your copy of the new G-E Magnet Design Manual, write: *Magnetic Materials Section of General Electric Company, 7814 N. Neff St., Edmore, Michigan.*

Adjustable Torque Handle

**controls clamping pressure
from 15 to 200 lb**

This adjustable torque handle controls clamping pressure on jigs and fixtures, assemblies, and machinery. End pressure is easily ad-

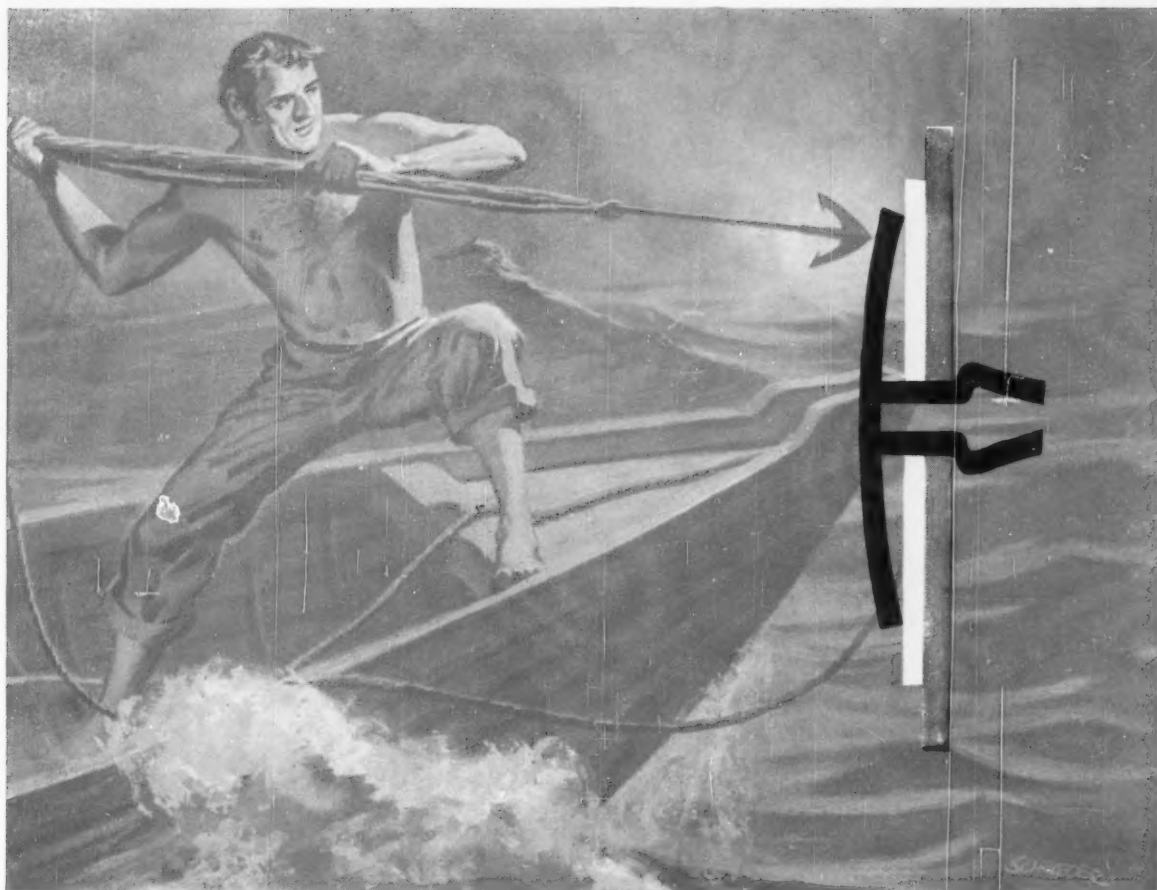

justable from 15 to 200 lb. Tapped hole is available in 5/16-18, 3/8-16, and 1/2-13 sizes. Aluminum handle is die-cast with an integral hardened-steel insert. **Vlier Engineering Inc., 8900 Santa Monica Blvd., Los Angeles 46, Calif.**

Circle 723 on Page 19

Small Clutch

**handles engines
up to 4 hp**

Model CL-57 is a small clutch developed for garden power tools, transmissions, marine applications, generators, pumps, and shop equipment. Weighing 2 lb and occupying a space of 2 1/2 in., it handles engines up to 4 hp. Clutch operates on the torsion-spring principle and has only three moving parts. It requires no end thrust, and delivers high torque at low rpm. It rotates in either direction, and torque arm can be located in any one of three positions. Each position is separated from the alternate positions by 120 deg, providing for attachment to power source at any point around the shaft.

HARPOON-ACTION FASTENER simplifies front mounting

Thrust this Tinnerman Dart-Type **SPEED CLIP®** through the front of a panel. Spring-steel fingers compress, then expand to lock tight, never to loosen until you pull the clip out.

This time-saving **SPEED CLIP** feature can be combined with other Tinnerman fastening principles and almost any spring-steel shape. Result—multi-purpose, cost-cutting fasteners that solve a variety of fastening problems. You eliminate screws, nuts, lock-washers, secondary fastening methods. You reduce parts handling and achieve a faster, smoother assembly-line flow.

YOUR SILENT PARTNER

BIJUR
AUTOMATIC LUBRICATION

HELPS YOU
 • effect real savings in your own plant
 • design savings into the equipment you make

Hand oiling is costly! It wastes time and money . . . steals valuable production hours . . . means extra down-time, fire risk, repair bills, replacement parts and causes product damage from excess lubricant.

But there's a way to end all this waste and worry. A Bijur Automatic Lubrication System never forgets a bearing . . . bearings never are thirsty for oil, never flooded. Lubrication is continuous, exactly right. All the hazards of hand oiling are banished—*automatically!*

Bijur Systems are custom-engineered for machinery used by practically all industries. Every bearing receives a clean supply of oil at the right time . . . automatically and correctly metered to suit its individual needs . . . while the machine is running! Whether for new equipment you buy, or machines you build, insist on Bijur. It's better—*by design!*

Seeburg designers choose P-K screws

**to match
the fastener
to the job!**

Joseph Kamys, engineer, J. P. Seeburg Corporation, Chicago, manufacturers of coin operated phonographs says, "Seeburg standards demand attention to every detail—quality workmanship and materials throughout. With Parker-Kalon screws, we can match the fastener to the specific application—be sure of dependable results."

Attachment of metal base molding and kickplate to a Seeburg cabinet, in a metal-to-wood application. "Rather than use ordinary wood screws, we power-drive P-K Self-tapping Type-A," says Mr. Kamys. "Holding power is far better, there's less chance of wood splitting, and fewer rejects at inspection."

Here, metal rims of two high-frequency speakers are fastened to a formed, one-piece, plastic housing. "In this metal-to-plastic application we have not only the problem of possible plastic breakage, but the fastener used must be highly resistant to vibration. We find P-K thread-forming Type-Z screws highly satisfactory."

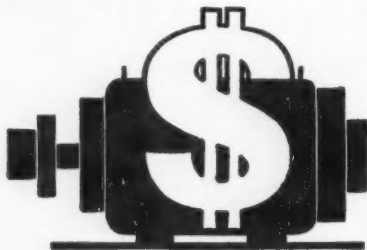

If you are designing a new product or new model, it will pay you to talk with a Parker-Kalon Field Engineer. He can help in the selection of proper fasteners, can often suggest ways to speed production—cut costs. You can contact him through your local Parker-Kalon Industrial Supply Distributor.

PARKER-KALON DIVISION, General American Transportation Corporation, Manufacturers of Self-tapping Screws, Socket Screws, Screwnails, Masonry Nails, Wing Nuts and Thumb Screws.

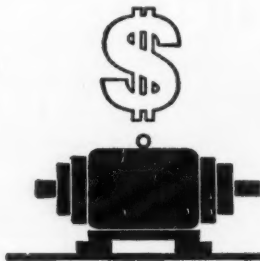

Sold Everywhere Through Leading Industrial Distributors. Factory: Clifton, New Jersey—Warehouses: Chicago, Illinois, Los Angeles, Calif.

PARKER-KALON® fasteners

When electrically driven equipment calls for...

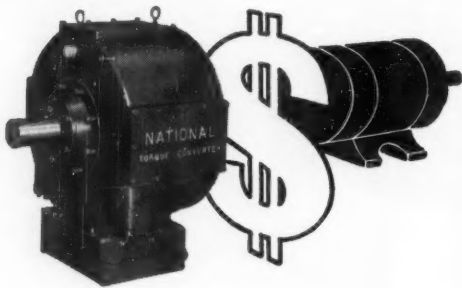

a special, costlier motor to start things

but only a low-cost motor to run them

Why not try this...

A National Torque Converter to give high starting torque

with your cost-saving motor to keep things moving

National Torque Converters give you "big motor" torque from small motor investment

Like a car in heavy traffic, the work-cycle of a lot of heavy, electrically-driven equipment is stop-and-go, stop-and-go.

If the motor is selected to take care of *running* requirements, it won't have the starting torque needed to pick up heavy loading fast. If the motor is selected for *starting* requirements, it is likely to cost considerably more—both to buy and to run.

The best answer is to install the more economical motor—and let it drive through a National Torque Converter. The converter will multiply the motor's torque for picking up the loads... ease the shocks and stresses of operation... bring economy in first cost and day-to-day service. National Torque Converters are available in a range of capacities from 100 to 1000 HP. For detailed technical information, just write:

WANT TO SEAL OPENINGS IN A JIFFY?

Tapered (non-threaded) CaPlugs can be used as caps or plugs, inside and outside of threaded or plain fixtures. Just push them on . . . or push them in. Costing less to buy, these versatile closures cost less to apply. Time studies show that tapered CaPlugs save up to 500% in labor costs.

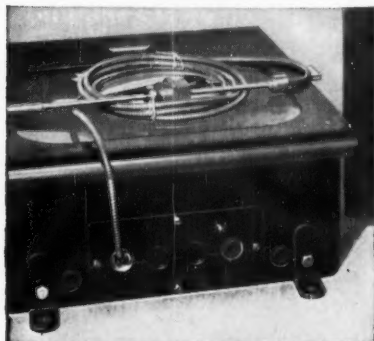

WANT TO KEEP FITTINGS UNDER WRAPS?

See how CaPlugs seal out dust and protect fittings of this refrigeration valve during shipment. Says Automatic Machine Products Sales Co., "It is important that the valve be free from contamination, since a large percentage of refrigeration systems are hermetically sealed and guaranteed for five years. CaPlugs are easy to install and afford the protection we desire."

WANT TO PROTECT DELICATE THREADS?

Kiekhaefer Corp. guards the threads on the "Ride Guide" steering controls of its Mercury outboard motor with *threaded style* CaPlugs. Here's long-lasting protection . . . the customer can reuse the CaPlugs when storing his motor. Made of tough, flexible Polyethylene, CaPlugs are especially kind to threads and polished surfaces — will not collapse, chip, break or shred.

WANT TO ADD SALES APPEAL?

Colorful CaPlugs spruce up your product and reflect the care you have taken to keep delicate systems free of dirt, moisture or foreign matter. This Bristol air control instrument is a good example. Says The Bristol Company, "They are sturdy enough so that they are not accidentally dislodged, but are still easily removable."

CAPLUGS FIT PRACTICALLY ANY CLOSURE NEED YOU CAN NAME.

Ten standardized designs (both threaded and non-threaded) are stocked in over 500 sizes to give you low-cost protection for tubing, fittings, valves, hydraulic components and machined parts of every description. Your immediate requirements can be met promptly with "off-the-shelf" deliveries from a multi-million inventory.

MAIL THIS COUPON FOR FREE CAPLUG SAMPLE KIT WITH DESCRIPTIVE LITERATURE AND PRICES

THE NEW "BELL RANGER" HELICOPTER USES HEIM UNIBAL ROD ENDS

Model 47-J is the latest helicopter to be introduced to the commercial market by Bell Helicopter Corp., and has been named the Bell Ranger. It is a four-place, executive type machine with a deluxe interior or a series of quick-change cabin arrangements for cargo, litter, and internal hoist configurations.

HEIM Unibal Rod Ends were chosen for the linkages in the carburetor heat and mixture control installations, and in the main rotor stabilizer bar assembly. The rods link hydraulic dampers to the bar, which provides exceptional stability to the flight characteristics of Bell helicopters, acting like a gyroscope and, through mixing levers, keeps the rotor plane of rotation in its pre-established flight path.

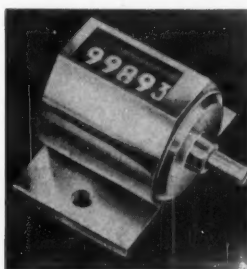

THE HEIM *Unibal* is the spherical bearing which corrects misalignment in every direction because of the universal movement of the ball — Reduces friction and lost motion in linkages — Eliminates the effects of vibration — Lowers assembly costs because of its quick and easy installation — Carries heavier loads.

Perhaps Heim can help solve — or simplify — your linkage problems. Feel free to write. Be sure each engineering and purchasing department has a Heim catalog.

THE HEIM COMPANY / Fairfield, Connecticut

New Parts

of 1000 per min, or count can be recorded at 1000 per min with shaft input of 100 rpm. Two types of ratchet action are available. Ratchet components are nylon for self-lubrication, low inertia, and positive action at high speed. All counters return to zero after maximum count has been reached. Units are available from **Techni-craft Co.**, 6221 Ridge Ave., Philadelphia 28, Pa.

VARI-MOUNT—the new Variable Speed Motorized Drive offers infinitely variable speed selection, greater flexibility of operation, wide adaptability, easier maintenance and the sound design you expect from Foote Bros.

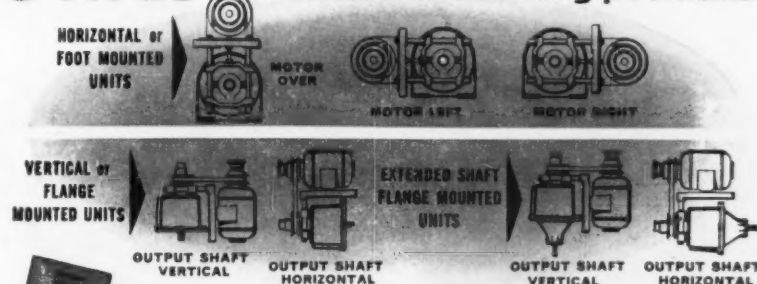

With a Vari-Mount, you can use your own motor—old or new NEMA Standard—or, the unit can be supplied with any standard motor of your choice. The Vari-Mount Reducer incorporates Duti-Rated Lifetime Gearing with file-hard tooth surfaces and tough, ductile cores for maximum life and efficiency.

Positive handwheel control of the adjustable pulley permits pin-point accuracy in speed selection over the entire range. Vari-Mount Units may be equipped with Remote or Automatic speed selection devices if required.

Spring loaded, self-centering Variable Pulley and close-coupled in line design insures permanent belt alignment, smoother performance, and minimum overhung load on motor bearing. No thrust load is imposed on motor bearings at any speed or during speed changes.

Quick belt changes made possible by the wide-open design of the Vari-Mount, together with easily accessible lubrication fittings make maintenance an easy matter.

WARNER ELECTRIC CLUTCHES EASILY CONTROL COMPLEX MOTIONS OF AUTOMATIC PINSETTER

Electric Motion Control Improves Automatic Performance, Gains Class II Electrical Approval

Here's how a manufacturer of automatic duckpin setters broke a bottleneck preventing use of the machine in many cities . . . improved machine performance . . . and reduced installation and service costs with Warner Electric Motion Control. The first pinsetters made by Crompton & Knowles Loom Works, Worcester, Mass. for Sherman Enterprises, Worcester, were equipped with mechanical transmission and braking controls . . . complex in operation, requiring extensive adjustment at installation and frequent service while in use. In addition, the voltage demand of the mechanically controlled units was so high that Underwriters' Laboratories refused approval, causing many cities to withhold operating licenses.

Use of Warner Electric Clutches was the solution to Crompton & Knowles' problems. The low operating voltage of the Warner system gained UL Class II Signaling Circuit approval . . . installation became greatly simplified . . . the timing sequence and operation more reliable and precise . . . and field service greatly reduced.

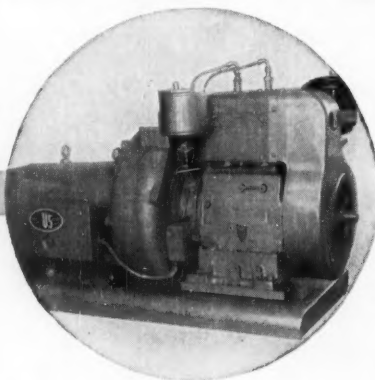

Warner Electric Motion Control systems offer you pushbutton, centralized control integrated with your machine's electrical circuit . . . expand the uses of all types of automatic control devices . . . give you the exact operating characteristics needed to do every job better, at lower over-all cost. You get faster, more precise starts and stops . . . and you benefit from simplified design and installation. Use the coupon on the next page to obtain the complete story on Warner Electric Motion Control.

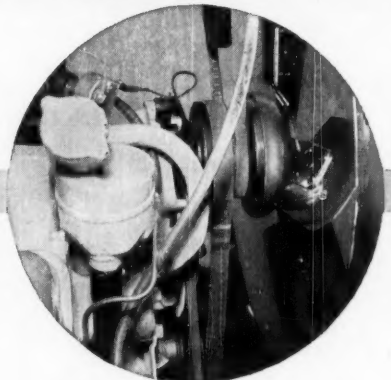

EASILY SOLVES POWER PROBLEMS LIKE THESE

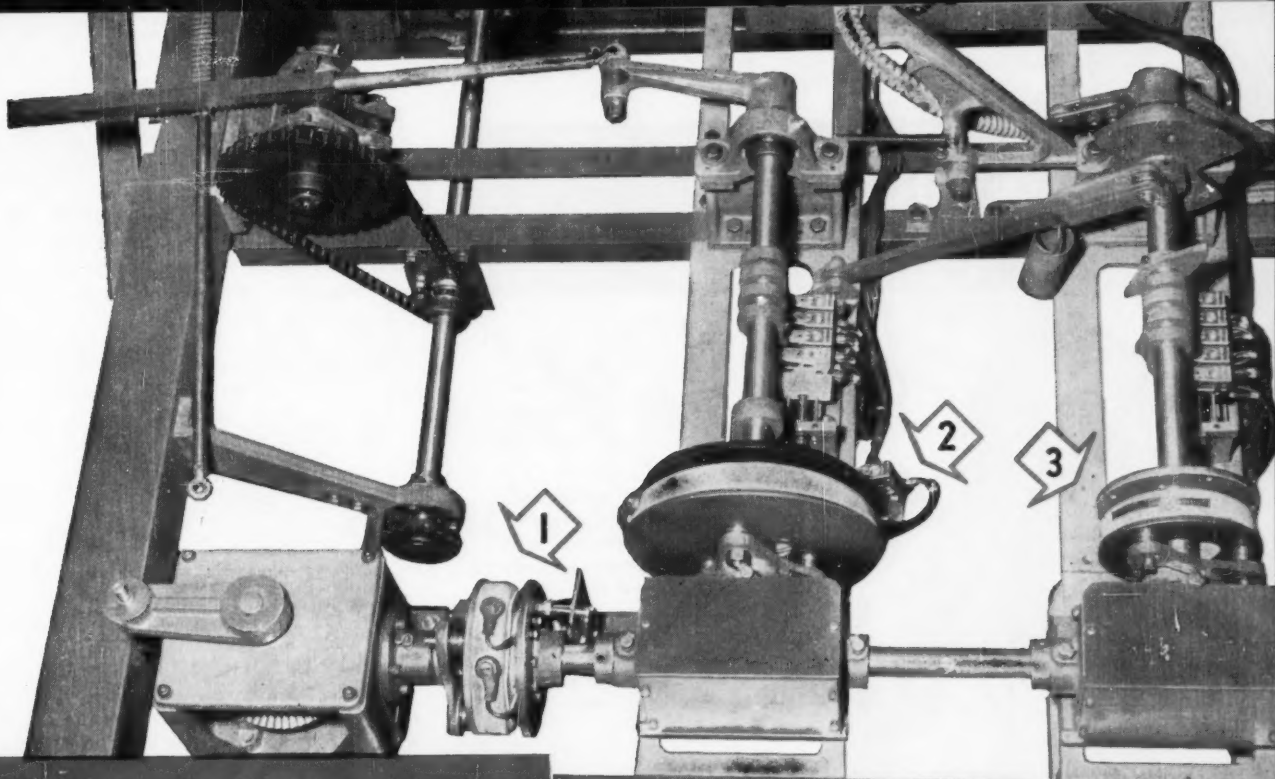

Automobile Air Conditioning—Automatic control provided by Warner Clutch has stationary magnetic field mounted on compressor seal plate and rotor keyed to compressor shaft with armature-pulley mounted on rotor hub. Pulley driven by engine crankshaft. Clutch field is energized by thermal control coupling armature and pulley, driving compressor. Control releases clutch when proper temperature is reached.

Stand-By Power Plant—Electric Clutch is mounted on shaft between heavy flywheel of continuously running electric motor alternator and gas engine. Power failure or drop disengages motor from prime supply and energizes field, engaging flywheel with engine. Inertia of wheel starts engine, preventing power interruption or variance. Sequence occurs instantly with only 4 or 5 volt lag for a few seconds on 110 volt lines.

Heavy Truck Fan Clutch—Clutch armature and fan are mounted on stationary shaft adjacent to rotor and pulley assembly. Integral rotor and pulley turn continuously. Field is mounted on water pump. Thermal switch in water cooling system energizes field, attracting armature and driving fan. Intermittent operation makes more horsepower available to the vehicle and provides faster warmups in cold weather.

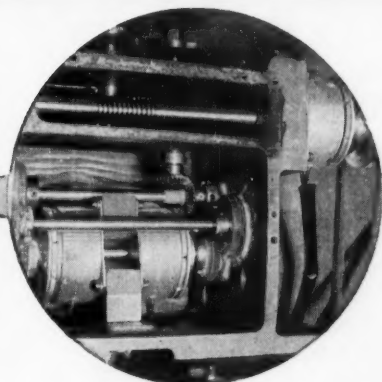

The distributor table is rotated past a chain pin conveyor until all ten cups are filled—pins are then held until needed by pin table. Warner Electric Clutch provides quick, precise control of full sequence.

1 When bowler steps on switch at the head of the alley, this Warner Clutch and timer arrangement activates the sweep arm to clear "dead" pins from the alley.

2 The pin table which places the pins in position or lifts them while sweep arm cleans alley is precisely controlled by this Warner Electric Clutch arrangement.

3 Pins lifted from the alley pit are received by the distributor table and delivered as required to the pin table. This Warner Electric Clutch actuates the delivery table sequence.

Bobbin Resistor Winder—Unusual use of Warner Brake on wire guide carriage. Brake is energized continuously to hold worm gear stationary as it traverses machine's screw. When brake is de-energized at end of winding operation, worm gear is released, returning carriage to start. Second brake on spindle stops winding at exact preset turn. Two Warner Clutches control winding and reversing traverse.

*Make it
Easier to Sell!*

... because with high quality fasteners your product earns a reputation for better performance and longer life service. Experience proves that the initial higher cost of quality components is offset time and time again by such things as operating efficiency, good appearance, better accuracy, etc.

Better Steel means Better Quality

The carbon steel heading wire used in the production of standard Hubbell Screws is A.I.S.I. Grade C-1010. Special application screws with higher strength or torque value requirements are produced from A.I.S.I. Grades C-1013, C-1020 and C-1035. Those subjected to drilling or subsequent tapping operations are produced from A.I.S.I. Grades C-1108 or C-1110.

All carbon steel wire used in the production of Hubbell screws, regardless of grade, is annealed in process material to specified tensile strength and is drawn to restricted size tolerance to insure the high Hubbell standards of quality and size in the finished screws.

Speed-Deviation Recorder

has accuracy to
1/10 of 1 per cent

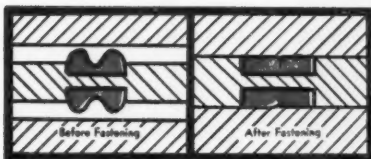

Type HE speed-deviation round-chart recorder is designed for use in processes where it is necessary to maintain constant speed, such as in the manufacture of nylon or other synthetic fibers, and in the steel, rubber, paper, and chemical industries. Unit has accuracy to 1/10 of 1 per cent. It indicates and records per cent deviation from a predetermined adjustable speed. Deviations as small as 0.01 per cent can be read easily on a highly expanded chart and scale. Recorder has high reliability in

DO YOU KNOW ABOUT GASK-O-SEAL?

The static seal that can not blow out!

The above diagram is "typical" only. Gask-O-Seals are also made with one-side seals.

If you do not know about Gask-O-Seals look at these facts:

- ✓ Gask-O-Seals will seal practically any processable fluid . . .
- ✓ Gask-O-Seals can be re-used . . .
- ✓ Gask-O-Seals will seal at low or high pressures, vacuum or positive . . .
- ✓ Gask-O-Seals are available as standards and as specials in almost any configuration or to meet special requirements.

They are recommended for flanges, gear boxes, transfer cases . . . any place where truly efficient static seals are needed.

Note: A recent development of the Gask-O-Seal principle indicates effective sealing in the temperature ranges of -400° to $+1000^{\circ}$ for specific applications.

Silicon Rectifier Diodes

for all power applications

Three silicon power rectifier diodes are hermetically sealed units providing dc forward currents to 1.6 amp with maximum peak inverse voltage to 800 v. They are designed for all types of power applications. Maximum forward voltage drop at 1 amp and 125-C case temperature is 1.3 v. Maximum operating frequency is 50 kc. Rectifier case is the positive terminal. Type 305 has a stud base for through mounting, Type 320 has a pigtail base, and Type 321 has a

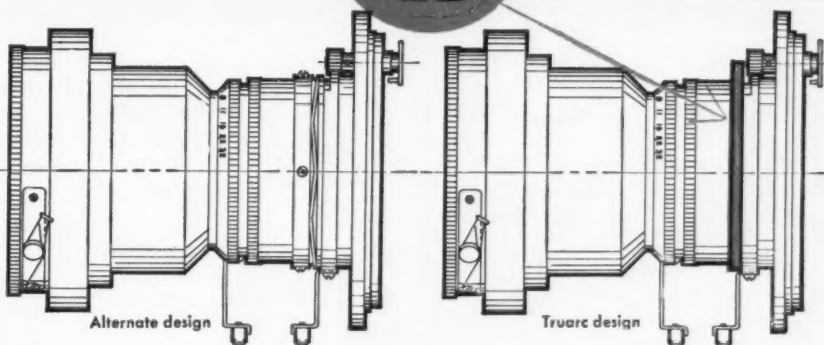

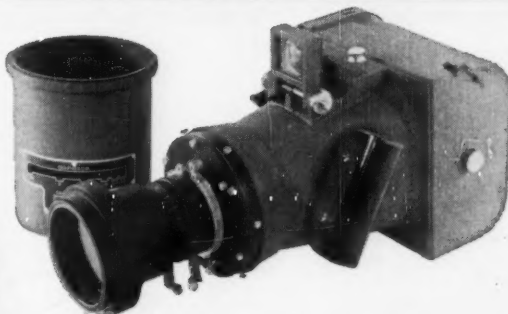

MACHINE DESIGN

Waldes Truarc Retaining Ring eliminates 7 parts, saves \$8.88 in sub-assembly of aerial reconnaissance camera

Gordon Enterprises, No. Hollywood, California, saved the Navy almost 1½ million dollars on 500 cameras. Gordon rebuilt new, efficient "CA" series out of Navy-owned obsolete models. Critical parts are now held together by Waldes Truarc Retaining Rings.

Truarc Rings are trouble-free, will not change position during operation. Accuracy is limited only by groove and ring dimension tolerances. And standardized Truarc Rings are quickly interchangeable in overhaul which now takes only 11 minutes, can be handled by unskilled technicians.

Truarc 5100-287 ring retains shutter speed adjustment mechanism on the Lens Adapter Plate Assembly which mounts and locks the lens

and shutter assemblies accurately to camera body. Alternate design required retaining washer, spring, collar and 4 locking screws.

Weight Saving: 7.25 oz.
Assembly Time
Saving: 6½ min.

DOLLAR SAVINGS:
Material \$.93
Fabrication 6.88
Inspection 1.07
Total \$8.88

Whatever you make, there's a Waldes Truarc Ring designed to save you material, machining and labor costs, and to improve the functioning of your product.

In Truarc, you get

Complete Selection: 36 functionally different types. As many as 97 standard sizes within a ring type. 5 metal specifications and 14 different finishes. All types available quickly from leading OEM distributors in 90 stocking points throughout the U.S. and Canada.

Controlled Quality from engineering and raw materials through to the finished product. Every step in manufacture watched and checked in Waldes' own modern plant.

Field Engineering Service: More than 30 engineering-minded factory representatives and 700 field men are at your call.

Design and Engineering Service not only helps you select the proper type of ring for your purpose, but also helps you use it most efficiently. Send us your blueprints today...let our Truarc engineers help you solve design, assembly and production problems...without obligation.

A TALENT FOR INVENTION: Leroy® Lettering Equipment—a K & E development—insures perfect neatness and uniformity, yet it is simple to operate and requires no special skill or training. One man can start a job and another finish it without any variation in lettering.

This K & E equipment comprises three basic, precision engineered parts: Leroy template, Leroy pen and Leroy scribe. Capitals, lower case, numerals, vertical or forward slanting letters can be drawn from a *single* template—an *exclusive* K & E feature. You can buy templates, pens, and scribes separately or in convenient sets.

Leroy templates offer a variety of alphabets, sizes and graphic symbols. Electrical, mathematical, mapping, geological and other symbol templates are available. Templates, with words or phrases that are frequently repeated, as well as templates with your own symbols, trade marks or designs, can be made to your order.

To save time and money in your drafting room specify K & E Leroy® Lettering Equipment. For other drafting or engineering equipment and materials also look to Keuffel & Esser Co.—your “Partners in Creating”—who have served engineering for 90 years.

Hydraulic Cylinder

is dual-speed unit

Thrust-O-Matic cylinder provides alternating speed and power cycles in the same basic unit, employing a single pump and motor. Completely self-contained, it is equipped with automatic valving. Shift from low-power, high-speed stroke to high-power, slow-speed stroke is effected by means of spring-loaded valves in the head, responding to increases and decreases in system pressure. Unit is basically a three-chambered cylinder. Two high-speed chambers are located around

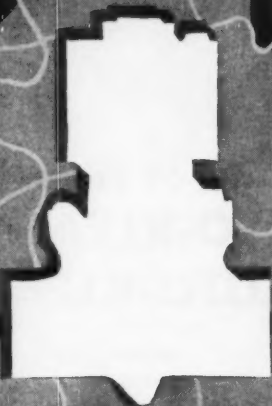

a third cylinder. Cylinder operates on the outer, high-speed chamber. When load increases, inner chamber becomes operative to provide maximum power at slower speed. When load drops, outer chamber becomes operative again. Opposing outside chamber provides high-speed retraction of the cylinder. **Crown Engineering Corp., 4700 Washington Ave., Houston 8, Tex.**

**MAGNETIC-FRICTION CLUTCHES, BRAKES,
CLUTCH-BRAKES, CLUTCH-COUPPLINGS**

**Are the Accurate, Trouble-Free Means of Controlling
Power and Motion in Modern Stop-and-Go Machines**

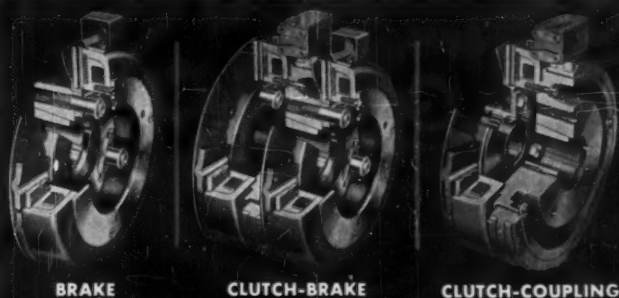

The Eaton Dyna-torQ electro-magnetic friction units include a number of unique design advancements which provide longer life and superior performance with less maintenance. Check the following important advantages:

- 1 **Extremely Rapid Response in Clutching and Braking**—makes Dyna-torQ units ideally suited to a wide range of manual and automatic cycling applications.
- 2 **Smooth, Shockless Engagement**—permits rapid operation without backlash or chatter.
- 3 **Highly Effective Cooling**—maintains lower operating temperatures; permits fast, repetitive actuation.
- 4 **Self-Adjustment**—automatically maintains proper clearance between armature shoes and field magnet.
- 5 **Simple, Accurate Control**—manual or automatic; may be had to operate on 110, 220, or 440 volt, 60 cycle, alternating current.
- 6 **Low Maintenance Costs**—result from unique design features and superior quality of construction, assuring long operating life and minimum down-time.

Eaton Dyna-torQ Clutches and Brakes are electrically operated, disc-type friction units having two basic components: a field magnet and an armature. Torque is transmitted as the magnet pulls the armature into engagement. Because the pull of the magnet is direct without intricate linkage, and the movement of the armature is slight, Dyna-torQ units are capable of extremely rapid response in clutching or braking.

Ask us to tell you how these Dyna-torQ units will fit your equipment.

**Here is a device which
every machinery designer
should know about . . .**

DUFF-NORTON WORM GEAR JACKS

Duff-Norton worm gear jacks provide a purely mechanical means for accurate positioning of loads weighing as much as several hundred tons and maintaining them indefinitely without creep. They will operate in any position, and functioning as components of machinery and equipment they can raise and lower loads, apply pressure or resist impact. Jack capacities range from five to 50 tons. When two or more jacks are connected by means of shafting and mitre gear boxes they lift in unison, even when the load is unevenly distributed. They are available with standard raises up to 25 inches, and will provide exactly the same raise for years without adjustment. Worm gear jacks are suitable for operation at ambient temperatures up to 200°F.

Thousands of these jacks are in use on feeding tables, tube mills, welding positioners, pipe cut-off and threading machines, testing equipment, aircraft jigs, loading platforms, rolling mills, conveyor lines, arbor presses, and numerous other types of equipment. If you have a positioning problem, write for complete information, requesting bulletin AD-34-V, which includes drawings and full specifications.

WELDED RESISTANCE WIRE Ohmite Resistors have the resistance wire welded to the terminals instead of soldered or brazed. This provides a perfect and permanently stable electrical connection that is unaffected by vibration or high temperature.

WELDED TERMINALS Another Ohmite Resistor feature is the welded terminal band. The band is permanently held together around ceramic core by means of welding, providing a strong, permanent fastening.

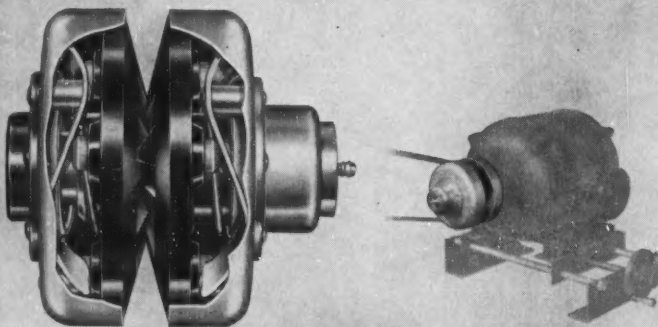

STRONG CERAMIC CORE This strong, rugged core has excellent electrical characteristics, and is unaffected by cold, heat fumes, or high humidity.

EXCLUSIVE HIGH TEMPERATURE VITREOUS ENAMEL This special-formula enamel was developed by Ohmite after extensive research. Its thermal expansion is properly related to that of core, terminal, and resistance wire.

Ohmite offers resistors in more than 60 sizes—ranging from 2½" diameter by 20" long to ¼" diameter by 9/16" long—to meet your exact requirements. MANY SIZES ARE CARRIED IN STOCK.

striving for **SIMPLICITY?**

here's how **HI-LO** helps

Design-wise, HI-LO automatic variable speed pulleys help you reduce complex design problems. Functionally, they're first choice of many design engineers for a wide range of applications. The simple, positive action of cam followers on cams is the mechanical action that takes place in maintaining the pitch diameter setting regardless of load—an exclusive feature of HI-LO pulleys. Springs in HI-LO pulleys are not driving members as in most spring-loaded pulleys, but serve primarily to keep the pulley faces in contact with the belt.

Air-Pressure Switches

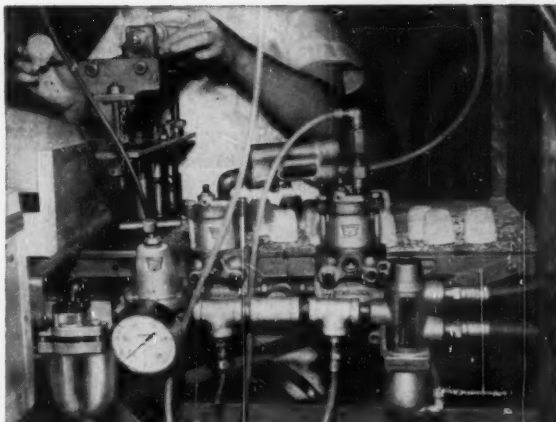

operate in dc or
single-phase ac circuits

Series RG18040 switches are for use in all types of airborne radar pressurization sets, and are intended for pressure-level control by direct connection to the air pump motor electrical circuit. They also operate low - pressure warning lights and interlock controls. Switches are single-pole, double-throw units, providing control under increasing or decreasing pressures, and operate in either dc or single-phase ac circuits with current load of 10 amp resistive. They perform without chatter over full operating pressure range, at any implied vibration frequency

Progress in designing air systems:

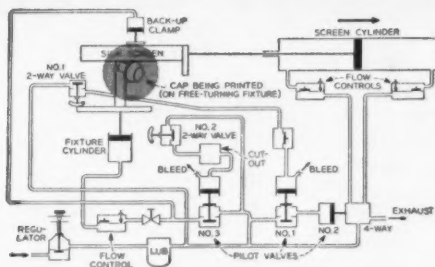

Here's an automating idea: Schrader Air Products in a precision programming operation

PROBLEM: To print bottle caps accurately at high speed.

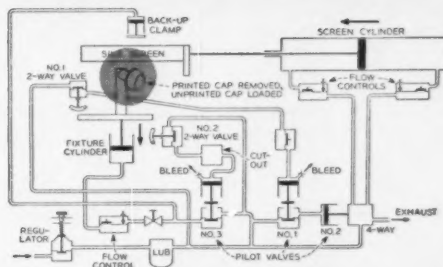

PROVED IN OPERATION: Prominent silk screen printer puts Schrader products to work at a profit.

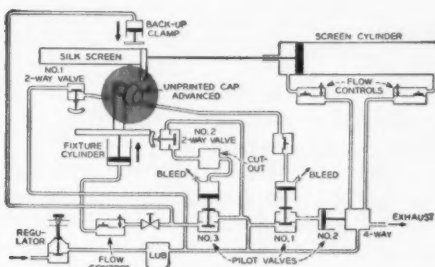

SOLUTION: Adapt Schrader Air Products to silk screen printer.

1 Fixture holding plastic cap on freely rotating fixture is held up against silk screen by Schrader cylinder. Another Schrader cylinder pushes screen sideways over the freely rotating cap, imparting the printed message.

2 Fixture with printed cap moves down, back-up clamp retracts and screen cylinder returns to initial position. Operator removes printed cap and loads another unprinted cap.

3 Schrader cylinder advances fixture upward loaded with unprinted plastic cap. Back-up clamp starts downward toward silk screen. And cycle starts all over again.

This is but one precision operation of the limitless operations which can be controlled *fast, economically and accurately* by Schrader Air Products. The hundreds of different units in Schrader's complete line can be employed alone or in combination to perform stamping, programming, forming, measuring, squeezing—other jobs too! And wherever air is used, economy is basic.

Test the performance of all your machines against the efficiency that could be achieved with air. Schrader engineering facilities are available to help you. Outline your problem to us and assistance will be prompt. Right now, mail the coupon.

EGYPTIAN DEITIES, Fatimas and Harems

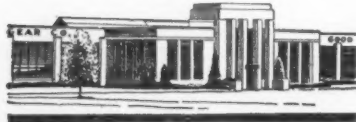

No, these aren't out of Arabian Nights, but were contemporaries of Murads, Condaxes, Richmond Straight Cuts and Sweet Caporals — all popular cigarettes of fifty years ago. Their sale was still illegal in several states, but where you could buy them they cost from 10c to 15c a package of 20 down south (where the popular brands used Virginia tobacco) to 15c to 25c a box of 10 up North (where straight Turkish tobaccos and cork tips were favored). They were a relatively new "fad" and considered by many to be objectionably "sporty".

In the ensuing fifty years the popular attitude towards cigarettes has changed considerably — and so have the cigarettes. As cigarette manufacturers have learned how to improve their product over the years, so have we learned a lot more about making better gears than anyone knew back in 1907. In fact, we've made a lot of progress just in the past ten or fifteen years. What about *your* present source of custom gears? A re-examination may show that it will pay you now more than ever to rely on Cincinnati Gear for your custom gear requirements.

Y MOTOR OFFERS ADAPTABILITY

This compact 4-pole shaded pole induction motor gives you a wide choice of horsepower, voltages, frequencies, starting torque, mounting provisions and other modifications. Standard models have horsepower ratings from 1/30 to 1/200 hp; free speed 1700 rpm; load speeds 1400 to 1700 rpm; 115v, 60 cycle, CW or CCW; high or low starting torque. Mounting provisions are 2 or 4 stud, flat strap, or saddle strap. Modifications include end or side ventilations; internal fan. Other voltages and frequencies are available. Typical applications are for vending machines, fans, aquarium pumps, etc.

The Y Motor is just one of many models in the comprehensive line of Heinze Sub-Fractional Horsepower Motors and Blowers. Send us your product and specifications. Heinze Engineers will adapt a motor at no obligation. Or write for catalog.

Circle 552 on Page 19

Ketos shaft being induction hardened to Rockwell 55-56, while ends remain soft for final machining. Photographed at Control Instrument Co., Inc., Brooklyn, N. Y.

KETOS has wide hardening range with minimum volume change...

Ketos is a low priced alloy tool steel that can be hardened from low temperatures with practically no volume change. It has deep hardening qualities, and a fine grained structure, that make it desirable for many production parts.

That's why nondeforming Ketos is well suited not only for most tool steel applications such as gauges, dies, and taps but also for close-tolerance, wear-resistant parts like the actuator bar shown in the induction heating unit above. The thin con-

tact edges of this particular part withstood a "life test" of over 4-million high speed blows. No other steel tested lasted more than 1-million cycles before it chipped and failed.

If Ketos sounds like the steel you should be using, call your nearby Crucible warehouse. Stocks of Ketos and dozens of other special tool steels are large, delivery fast. *Crucible Steel Company of America, The Oliver Building, Mellon Square, Pittsburgh 22, Pa.*

RELAYS AND CONTACTORS

Bulletin 200, Type G Relay.
Rated: 5 amp, 64 v; 2 amp,
125 v; 0.5 amp, 250 v.

Bulletin 202 Contactor,
Size 2, 1 Pole. Rated: 50
amp, 115-230 v.

D.C. relays are made with up to 8 poles. Also universal types, having contacts changeable from N.O. to N.C.—or vice versa—by merely reconnecting the terminals. Up to and including the 150 ampere rating, D.C. contactors are of the solenoid type; beyond this rating, up to and including 600 amperes, the clapper type construction is used.

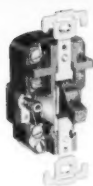

Bulletin 700, Type C.
Rated: 10 amp, 550 v max.

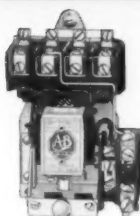

Bulletin 702, Size 2, 3 Pole.
Rated: 50 amp, 550 v max.

A.C. relays are made in different types for various applications, with up to 8 poles. The universal type, having contacts changeable from N.O. to N.C.—or vice versa—is very popular. The A.C. solenoid contactors, made in 9 ratings up to 900 amp, 550 v max., will satisfy any service requirement. Silver alloy contacts are used throughout the D.C.-A.C. solenoid relay and contactor lines.

CROSS-THE-LINE STARTERS

Bulletin 600, Form 52,
double pole only, open
type. Max rating: ¾ hp,
115-230 v.

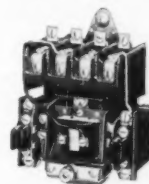

Bulletin 209, Form 2. Max
rating: 1½ hp, 115 v; 2
hp, 230 v.

D.C. manual starters have a rugged, snap action mechanism that prevents contact "teasing" and thus prolongs contact life. D.C. manual and solenoid starters have maintenance free, double break, silver alloy contacts. Motor overload protection is reliable.

Bulletin 600 in general
purpose enclosure, com-
plete with reliable over-
load breaker. Rated: 1
hp, 110-220 v.

Bulletin 709, Size 1. Rated:
7½ hp, 220 v; 10 hp,
440-550 v. Same general
construction for max rat-
ings of 300 hp, 220 v; 600
hp, 440-550 v.

All Allen-Bradley A.C. motor control is equipped with silver alloy contacts which are always in good operating condition. Because all A-B solenoid starters have only one moving part, trouble free performance and long life are automatically assured. It is the basic reason for Allen-Bradley's "quality" reputation.

A.C.

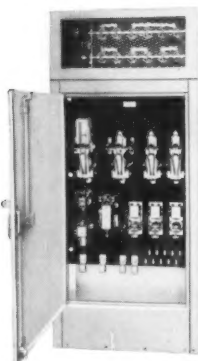

REDUCED VOLTAGE STARTERS

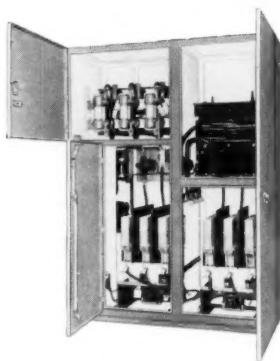

BULLETIN 267 are time limit, resistor type starters for automatic acceleration of constant speed shunt and compound wound D.C. motors. Solenoid contactors used up to and including Size 4 ratings. Max ratings: 75 hp, 115 v; 150 hp, 230 v.

BULLETIN 740 are graphite resistor type starters for automatic acceleration of squirrel cage A.C. motors. Made with 1 or 2 points of acceleration. Can provide velvet smooth acceleration for squirrel cage motors. Max ratings: 200 hp, 220-440-550 v.

BULLETIN 268 are time limit resistor type starters for automatic acceleration of adjustable speed shunt and compound wound D.C. motors. Designed for heavy duty service. Both Bulletin 267 and 268 starters available with or without dynamic braking feature, and also for reversing service. Max ratings: 75 hp, 115 v; 150 hp, 230 v.

BULLETIN 983 high tension starter illustrated above is of the reactor type, intended for starting synchronous motors. Available as an autotransformer reduced voltage starter; also in the across the line construction. The heavy duty, solenoid air break contactor assures long, trouble free life. Max ratings: 1500 hp, 2300 v; 2500 hp, 4600 v. at 0.8 P.F.

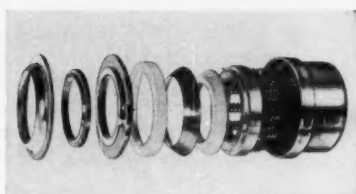

The Allen-Bradley quality line is not limited to alternating current motor control. A companion line of direct current motor control is available with the same outstanding quality . . . the same reliability . . . the same ability to "take it." Both lines are described and listed in our latest A-B Handy Catalog, and our trained field engineers will also be glad to help you with your control problems.

You cannot make a mistake when you insist on Allen-Bradley control.

SODECO's New Type 1TD Electric Impulse Counter—

for: NORMAL COUNTING...

**TRANSMISSION OF A NUMERICAL INDICATION
REMOTE PRESETTING FOR PREDETERMINING CONTROL**

You can use these rugged single decade counters independently as decades or interdependently as a multi-digit counter to get practical solutions to an extremely wide variety of counting problems. Ten different contact arrangements are available to solve a number of problems. For example, an interesting application is the use of any number of decades as a remote predetermined counter in which any preselected number can be set up quickly from a remote location and made to operate a signal at either or both locations when the count returns to zero. In this application, if desired, the preselected figure could be set up from a punched card. The counters are small, measuring only $\frac{7}{8}$ " x $1\frac{1}{4}$ " x $4\frac{3}{8}$ ", and are suitable for flush mounting. Fast, models are available with speeds up to 25 impulses/second. Power requirements are low—permitting their installation in electronic circuits. Long lived, tests indicate certainty of operation up to at least 50 million impulses.

Complete technical data is available, including circuitry recommended for a wide range of use. Write for Bulletin 60.

Air conditioning heat pumps are made stronger and lighter by General Electric with economical Lukens pressed heads.

Ingenuity pays off... designing with Lukens heads

■ Ingenuity ... and four Lukens heads ... meant considerable savings and increased strength in these General Electric Weathertron heat pumps. Designers at General Electric's Air Conditioning Division, Bloomfield, N. J., eliminated the need for expensive castings by making the pump compressor housings of Lukens heads, pressed to extremely fine tolerances. Fitted together they result in stronger and lighter units.

Whether you make heavy or light machinery, valves, wheels, or pumps, Lukens heads may be the answer to a costly fabrication problem. Designers have been using them for years. Lukens' fifty-five years as the leading producer of spun and pressed heads for many applications are at your service. Write today for Catalog 933, "Pricing and Engineering Data," Lukens Steel Company, Coatesville, Pennsylvania.

Lukens Offers the World's Broadest Line of Spun and Pressed Heads of Carbon, Alloy and Clad Steels

chain drives in action

help clean dirty streets

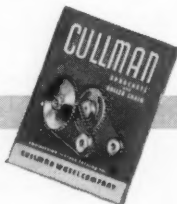

Around sharp corners on highways, parks, streets, alleys, Mobil-Sweepers cut street-sanitation costs 45%. And, do it with low maintenance expense. These efficient vehicles, built by the Conveyor Company in Los Angeles, eliminate extra pick-up and hauling equipment. They sweep from 1½ to 10 m.p.h. . . . carry away full loads at truck speeds. And, reduce street-sanitation to a simple, safe, one man operation.

To insure such performance Cullman chains and sprockets are used throughout. They rotate the sweeping brooms and drive the conveyor that feeds dirt into the hopper. Operating under wet or dry abrasive conditions they overcome shock loads, extend equipment service life, lower upkeep costs.

here's how chain drives can work for you . . .

On your products too, Cullman chains and sprockets can achieve similar advantages, help deliver top performance. Next time you're faced with a power transmission problem write direct or call in a Cullman man. He'll be glad to assist you . . . and recommend the right chain drive for your job.

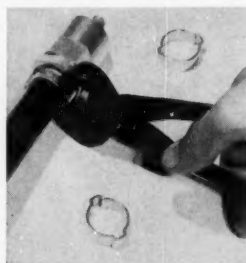

For the full story on the Cullman power transmission line — roller chains, sprockets and flexible couplings, write today for catalog No. 51, or see your local Cullman Distributor.

WHAT ARE AMWELD FLASH WELDED RINGS?

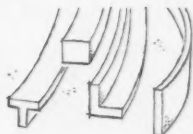

They are rings formed, flash butt-welded, and shaped into the finest quality circular weldments available.

They are rings that offer savings of critical materials. Bar stock formed and flash welded uses considerably less material than rings made by other methods.

They are rings that offer additional manufacturing savings. Since the rings are closer to the desired finished cross section, it is less expensive to machine them to a final dimension. Oh yes, Amweld will machine them for you.

They are rings made by a company with experience in design. We can help you select a mill-rolled or extruded shape that is even closer to the finished ring dimension. This can give you additional savings.

Yes, Amweld flash-welded rings can give you extra profit from savings on material and machining time. Amweld rings can be made of most weldable ferrous or non-ferrous metals in sizes from 4 to 96 inches.

THE AMERICAN WELDING & MFG. CO. • 130 DIETZ ROAD, WARREN, OHIO

NEW: Formsprag Sealed Clutch Series

LOCKS LUBRICANT IN

SEALS DIRT OUT

Now available—the new series “B” and “C” Formsprag Ball Bearing Sealed Clutches—designed for backstopping, indexing and low speed over-running where inner race over-runs.

The “B” is intended for over-running applications where both races rotate during some portion of the operating cycle. The “C” series should be selected if the application is one of indexing or if the outer race is to be fixed, as in a backstopping application.

Available in bore diameters ranging from 2 1/4" to 5 1/2", these new clutches have torque capacities from 1875 to 11,600 ft.-lbs. So you get unusually compact power transmission, the ultimate in accuracy, and exceptionally long service life. What's more Formsprag clutches may be reconditioned twice before obsolescence at a fraction of the cost of a new clutch.

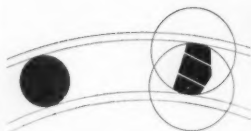

CHECK THESE CAPACITIES

Model No.	Maximum over-running speed RPM	Torque capacity lb.-ft.	Maximum bore diameter
FSB-700	900	1,875	2 1/4"
FSB & FSC-750	600	3,160	2 3/4"
FSB & FSC-800	600	4,200	3 1/2"
FSB & FSC-900	600	6,000	4 1/2"
FSB & FSC-1000	500	11,600	5 1/2"

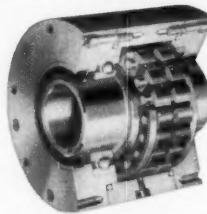

WHY IT PAYS TO DESIGN “THE FORMSPRAG PRINCIPLE” INTO YOUR PRODUCT

Sprags are an advanced design of precision wedges made of hardened alloy steel. Utilized in a clutch, they increase the efficiency and prolong the life of all equipment using an over-running clutch or ratchet.

The sprag is, in effect, a “roller” of increased diameter with greater contact surface in a given annular space—therefore, of increased torque capacity.

Designed for backstopping, indexing and low speed over-running service where inner race over-runs. Formsprag will make selection of either “B” or “C” series when application data sheet accompanies order.

See our catalog in

NEW ROBBINS

"SERIES 254U" RE-RATED

FIVE BIG

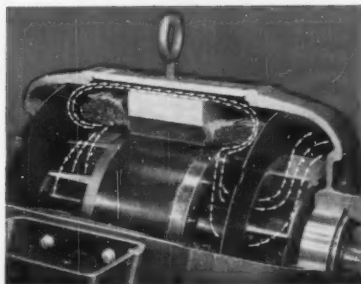

FULL HEIGHT END HEAD PROTECTION
One piece shrouded end heads give full height protection against moisture and falling objects. Internal baffles complete splash-proof construction.

& MYERS

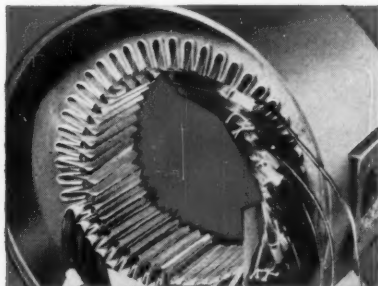

MOTORS offer you...

ADVANTAGES!

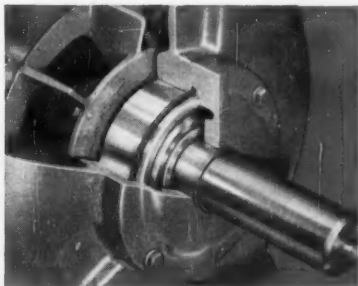

"STRAIGHT THROUGH" DUAL-SWEEP VENTILATION ELIMINATES "HOT SPOTS"

Tandem fans, one pushing and the other pulling, produce washing action around and over field coil ends, insure lower internal temperatures and longer dependable operation.

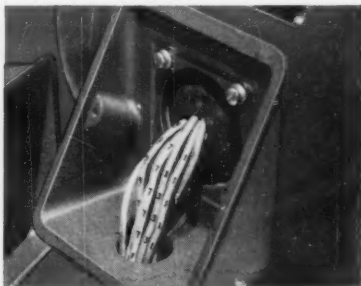

MYLAR* INSULATION INCREASES MOTOR LIFE. Mylar*, laminated to rag paper insures positive insulation and assures virtually permanent protection because of its excellent dielectric qualities. In addition, the rag paper backing provides a cushioning effect for added resistance to abrasions and punctures.

*DuPont registered trademark.

BEARINGS EASILY INSPECTED

Removable cover plate at each end of head permits easy bearing inspection without dismantling motor. Bearings run in double-width races, thus have extra-large reservoirs containing grease selected to resist dust, temperature, humidity and high operating speeds.

PERMANENTLY NUMBERED LEADS SIMPLIFY INSTALLATION AND MAINTENANCE

Proper lead identification is assured even after years of exposure. Numbers are permanently impregnated into the sub-surface of the insulation... can't wear off or deteriorate.

THESE five big advantages make R&M's "Series 254U" re-rated motors your best buy for applications requiring dependable, full-time performance. They can be installed in any environment, outdoors without a cover or in damp and corrosive atmospheres. Moisture, rust or corrosion can't affect their operation, and they take rugged duty in stride! Every R&M motor is electrically and mechanically designed to withstand the most severe operating conditions. Careful quality control and precision manufacture insure top performance and dependability year after year. Write today, for R&M Bulletin 520MD on R&M's "Series 254U" re-rated motors!

Intricate Allegheny Ludlum Steel Extrusions **cut material needs up to 60%, slash machining costs**

**Write for this
technical book
on A-L Steel Extrusions**

12-pages of design and engineering information on steel extrusions. Process and product explanation, material properties, design tips and limitations, tolerances, order instructions, etc.

Address Dept. MD-96

There's no doubt about extruded shapes saving money on materials and on machining. Non-ferrous applications in the last decade have proven it.

Now even greater savings are possible with tough, strong metals in Allegheny Ludlum Hot Steel Extrusions.

Extruded shapes in all stainless grades, tool steels, carbon steels, electrical steels, high temperature alloys . . . even in zirconium, nickel alloys . . . are now in production at Allegheny Ludlum, cutting costs in many different industries.

If you're hogging out sections, paying for special mill rolls on small orders, or

waiting for minimum rolling mill tonnages, Allegheny Ludlum Steel Extrusions are your answer. They will save you scrap loss, slash your machining costs, hold down your inventory requirements and cut delivery time. Charge for die design is low—under \$200. Orders taken for as little as 40 pounds.

To learn more about the time and cost-cutting possibilities of Allegheny Ludlum Hot Steel Extrusions, send for the technical booklet at the left or call any A-L office for technical assistance.

LORD FACTS ON VIBRATION

IMPROVING PRODUCT PERFORMANCE IS OUR BUSINESS!

When the performance of your product can be improved with vibration control or with bonded-rubber components, you can rely on LORD for the most effective solution to your problem.

In the first place, you can benefit from LORD'S thirty years of experience devoted exclusively to designing and developing bonded-rubber products for every type application—with thousands of successful solutions in the "completed" file.

Second, you can draw upon LORD'S unparalleled knowledge of vibration problems and the designs and materials that produce the best results under any specific condition.

Third, LORD has extensive research and development facilities in addition to the Engineering Division and the LORD Field Engineers—all available and geared for immediate and effective action in solving product problems involving vibration control or bonded-rubber products.

These advantages are available at LORD—A letter will bring them to you. Simply write to Erie or the Field Engineer nearest you.

Circle 758 on Page 19

When it sings out, engineering mysteries unfold

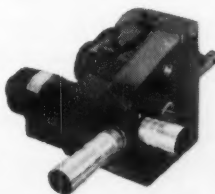

The high-pitched whine of a high speed camera is bursting forth more and more often in modern engineering laboratories. For engineers have found that ultra-slow-motion movies make trouble shooting in fast-moving parts more a matter of intelligent visual analysis than of tedious cut-and-try experimentation or calculation. And that leaves them more time for design and development work.

The high speed camera we make is primarily for the practical engineer to use in helping solve his day-to-day problems. Its top speed is a reasonable 3200 pictures a second. That slows action 200 times when you project the 16mm film at normal speed, enough in the great majority of mechanical problems to see what's going on. You don't burn up more film than you need and the instrument is simple and rugged enough for a busy man to use without trouble.

The best way for you to evaluate the Kodak High Speed Camera in terms of your own needs is to send for a booklet that not only gives you the details but quite a few case histories on how it has been used in a variety of industries. You get the booklet by writing to *Graphic Reproduction Division*,

PALNUT® LOCK NUTS and FASTENERS

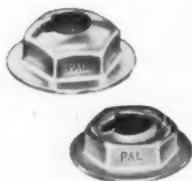

REDUCE — PARTS — OPERATIONS — COSTS

Spring-tempered steel PALNUT Lock Nuts and Fasteners cost less than other lock nuts and locking devices—less than plain nuts, in most cases. A single PALNUT replaces two, three, even four fastening parts according to application and type used, thus fewer parts to buy, stock and assemble. Simplified, high speed assembly is gained with PALNUT magnetic sockets, shanks and applicators which pick up, start and tighten in one operation. Self-locking spring grip keeps parts tight under vibration. Many types and sizes offer savings for products in every field.

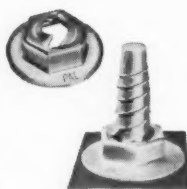

**REGULAR
TYPE**

Self-locking hex nuts securely fasten wide range of light assemblies. Require only 3 screw threads. Save weight. Also used on top of ordinary nut for vibration-proof fastening of assemblies.

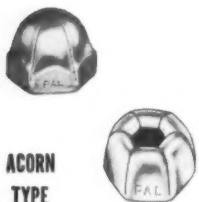

WASHER TYPE

One-piece lock nut and flat washer replaces ordinary nut, lockwasher and flat washer. Many variations for mechanical and electrical assemblies. Available with bonded-in plastisol sealer.

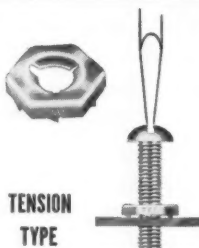

SELF-THREADERS

Form deep, clean threads on unthreaded studs, rivets and rods while tightening. Save threading costs. Provide strong, vibration-proof assemblies. Fast assembly with standard tools. Remove and re-use on same studs.

**ACORN
TYPE**

Pleasant dome shape covers rough screw ends, dresses up products, keeps parts tight. Also semi-acorn type with prevailing torque anywhere on threads. Very low cost.

**TENSION
TYPE**

Simplifies adjusting screw assemblies. Nut is tightened once, never touched again. Use only screwdriver to adjust screw. Positive grip.

**PUSHNUTS® for unthreaded
studs, rods and rivets.**

Simply push on, they lock with powerful grip. Save threading, notching, cotter pins.

WING TYPE

Lock securely when finger tightened, stay tight in service, easily removed when finger released. Cost less than ordinary wing nuts.

Write for literature and free samples of any type PALNUT Lock Nut, stating application and size. Consult our fastening engineers on any assembly problem.

HERE'S YOUR ANSWER

Speer carbon and graphite parts are not wetted by molten metals. They hold their shape with no warping, regardless of temperature. They have high heat transfer and will not break down under severe thermal shocks...will not crack or split...are chemically inert.

Easily machined or fabricated, Speer carbon and graphite parts can be provided in almost any size and shape to your *exact* dimensional tolerances. If you have a design problem involving high temperatures, examine the advantages—and economies of Speer Carbon. Speer's knowledge and experience is yours for the asking—mail the coupon today for further details.

MAXITORQ "DISC-PAC"

A COMPACT UNIT FOR BUILDING YOUR OWN CLUTCH

Due to a growing demand for Maxitorq Floating Discs, the MAXITORQ DISC-PAC has been made available as a self-contained unit independent of the actuator.

Patented Maxitorq Separator Springs that prevent drag, abrasion, and consequent heating in neutral . . . and the Maxitorq Locking Plate which locks all discs onto body . . . give you the outstanding features that are so highly favored by machine and product designers.

Thus you may build your own clutch or brake from our standard stock Maxitorq parts. The Disc-Pac keys to your shaft and is easily replaced. Units are available in 8-disc diameters from 2" to 8"; $\frac{1}{4}$ to 15 h.p. at 100 r.p.m. . . . with 3 lugs on the smallest size, 8 lugs on the 3 h.p., and 12 lugs on the 5, 10 and 15 h.p. capacities.

The Disc-Pac fits Maxitorq standard Driving Rings in the event that you want to use them. As with the Maxitorq Clutch, all assembly, take-apart and adjustments are manual . . . no tools required. For further information, write Dept. MD-12.

THERE MUST BE AN EASIER WAY

MIDLAND WELDING NUTS

The Midland Steel Products Company is constantly developing new, progressive ideas to improve the efficiency of its fine products. It pioneered the *Midland Welding Nut*, for example, and so successful was this application in its own shops that this labor-saving device has been made available to others.

If you are a manufacturer of metal parts or products and have fastening, fabricating or assembling problems, you may find Midland Welding Nuts just the solution you've been looking for. The Nuts are easily welded into position for the lifetime of the product. You can be assured of correct fit, even in the most awkward, hard-to-reach places. Bolts turn easily into the applied nuts. Thus, heretofore two-man operations can be handled by one man in most instances. Weld-nut equipped parts will be preferred by your customers for they will find them cost-saving and trouble-free, cutting down assembly time. Too, you can be sure that your parts will be properly assembled without the risk of rattles.

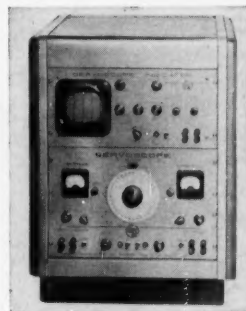

A few minutes' time in checking the assembly problems of your customers will be profitable to you. Midland Welding Nuts are low in cost, can give you a definite advantage over competition. This practical application is recognized internationally and endorsed by many designers of the finest products.

Formica

helps solve rocket thermal insulation problems

New Formica laminated plastic thermo-insulator provides protection from hot launching gases

In cooperation with Rocket Fuels Division, Phillips Petroleum Company, Formica application engineering applied Grade FF-34 (modified) with the precise characteristics for protection against hot gases.

This Formica fabricated liner protects the steel blast tube through a time cycle of intense heat in a new target drone.

This solution called for three of the Formica-4 services that assure the right laminated plastic for every requirement.

1. Application engineering to select the right grade
2. Research to adapt it to this particular application
3. Fabricating to produce a complete component ready for assembly. A fourth—Customer Stock Service—provides a ready supply of sheets and rods for prompt shipment.

This unique laminated plastics service can be of assistance to you in your own product design problems. For complete information, send for free Formica-4 bulletin 584. Formica Corporation, a subsidiary of American Cyanamid, 4514-7 Spring Grove Ave., Cincinnati 32, Ohio.

PACKAGED

Oil-Free COMPRESSED AIR

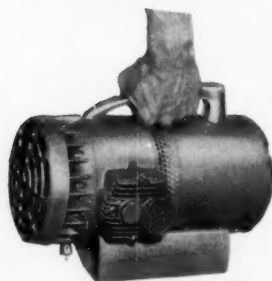

AIR WHERE YOU WANT IT... COMPLETELY OIL-FREE... COOLER... DRIER!
Expensive lubrication maintenance completely eliminated!

Where *clean* compressed air is essential, the B&G Oil-less Compressor provides the answer in a complete line of portable, tank-mounted and tankless models.

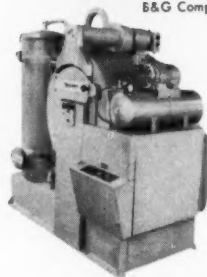

There is no oil required in this new design unit! Motor and compressor are permanently grease packed... graphite piston rings and skirts operate for years without destroying the mirror-finish of the cylinder walls. Since the cylinders are not lubricated, oil-free air is delivered at all times without need for an oil separator.

B&G Compressors are really *smooth*! Modern design large bore, short stroke, horizontally opposed pistons provide better balance and vibrationless operation. Compactness and light weight adapt them ideally to either portable or built-in applications. In every detail these units are designed to deliver *maximum air per horse power*!

For complete information on B&G Oil-less Compressors and Vacuum Pumps, send for Catalog GO-1156.

NYLAFLOW® PRESSURE TUBING

NYLAFLOW® gives you high strength, long flex life, light weight

NO OTHER tubing offers the same unusual combination of physical properties with ease of installation ... to provide lower costs, long tubing life.

Nylaflow is a tough, flexible polyamide tubing being used successfully in many industries for air lines, grease and oil lines, low pressure hydraulic lines, beverage lines and other applications.

These are Nylaflow's unique characteristics:

- High burst pressure at low cost
- Extremely long flex life
- Tough—wear and crush resistant
- Hornlike, can be used with standard fittings
- Easily bent for installation—can be held with clips or permanently pre-bent with heat
- Serves over wide temperature range
- Resistant to solvents, oils, alkalis, hydraulic fluids
- Odorless, tasteless, non-corrosive, non-toxic, fungus resistant

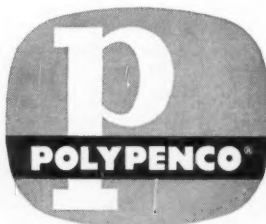

The design and performance capabilities of Nylaflow are outlined in a new bulletin available from The Polymer Corporation of Pa., Reading, Pa. Write for your copy today.

for slow-speed operation

Model TT-100 multichannel magnetic tape recorder operates in —20 to 165 F temperatures. Designed for slow-speed operation, unit provides up to three record channels at speeds from 0.05 to 1 7/8 ips using 1/4-in. tape on 5-in. NARTB reels. Instrument weighs 5 lb and occupies a space 12 x 6 x 4 in. Power requirement is 6 v dc, ranging from 100 to 300 ma. **Precision Mechanism Co.**, 922 Terminal Way, San Carlos, Calif.

WHICH of these Actuation Problems are YOURS?

☐ POWER CONSUMPTION

☐ SPACE/WEIGHT

☐ PRECISION

☐ TEMPERATURE

☐ LUBRICATION

☐ DEPENDABILITY

SAGINAW b/b SCREWS will help you solve them!

**ORIGINAL DESIGNERS
AND PRODUCERS
OF MULTIPLE
CIRCUITS**

If one circuit should fail, the rest will function without interruption, sharing the load between them. In critical applications this feature has no equal.

6 BASIC DESIGN ADVANTAGES

1. Vital Power Savings. Permit much smaller motors with far less drain on electrical system, simpler circuitry.

2. Space/Weight Savings. Screws themselves are smaller, lighter; permit smaller motors and gear boxes; eliminate auxiliary equipment required by hydraulics.

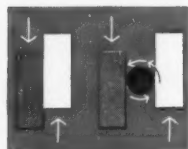

3. Precise Positioning. Machine-ground type will position components far more precisely than hydraulics or pneumatics; tolerances on position are held within .0006 in./ft. of travel.

4. Temperature Tolerance. Normal operating range from -75° to +275° F.; in selected materials, will function efficiently at temperatures as high as +900° F.

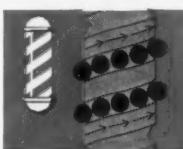

5. Lubrication Latitude. If lube fails, will still function with remarkable efficiency. Units have been built and qualified for operation without lubrication.

6. Fail-Safe Performance. Far less vulnerable than hydraulics; Gothic-arch grooves, yoke deflectors and multiple circuits provide added assurance against failure.

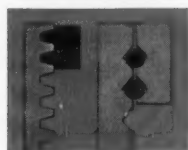

Here's why they're 90% efficient, save 4/5 on torque:

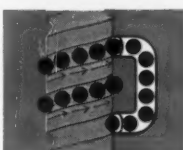

Let's start at the beginning, with the familiar principle that there's far less friction in *rolling* than in *sliding*. By applying this principle,

Like stripes on a barber pole, the balls travel toward end of nut through spiral "tunnel" formed by concave threads in both screw and mating nut.

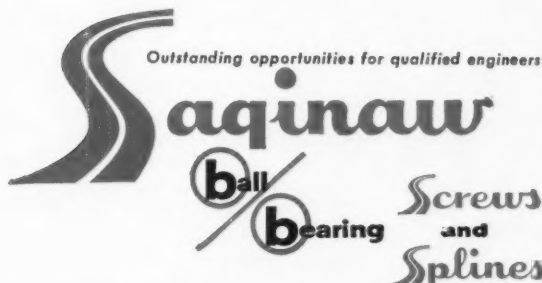

the Saginaw ball-bearing Screw radically increases the efficiency of rotary-to-linear motion (and vice versa). Instead of *sliding*, mating surfaces *glide* on rolling steel balls.

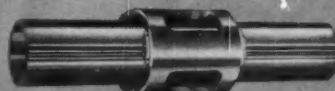

At end of trip, one or more tubular guides lead balls diagonally back across outside of nut to starting point, forming closed circuit through which balls recirculate.

Available in custom machine-ground and stock rolled-thread types. Units have been built from 1½ inches to 39½ feet long—¾ to 10 inches in diameter.

SAGINAW STEERING GEAR DIVISION OF GENERAL MOTORS • SAGINAW, MICHIGAN
WORLD'S LARGEST PRODUCER OF BALL BEARING SCREWS AND SPLINES

SAGINAW b/b SPLINE

This revolutionary new kind of spline utilizes the same basic principle pioneered by Saginaw in the ball bearing screw.

It permits new engineering designs never before practical—literally lets you achieve the "impossible"! In any application where column length must change under torque load, the Saginaw b/b Spline offers greatly decreased friction, less wear, longer life, more dependable operation. It can be fitted with integral gears, clutch dogs, bearing and sprocket seats or a wide choice of other attachments for use with electric, hydraulic or pneumatic units. To convert push-pull to rotary motion, helical types are available with very high leads, ranging from 20:1 to 100:1.

made in one piece—in one stroke as an **ALCOA IMPACT**

Faced with the problem of designing this center-tube impact as a one-piece part, a designer who is not familiar with Alcoa® Impacts would throw up his hands. Then he would break out the slide rule to start figuring costs on welding the center tube to the base. After that, he'd have to puzzle out an inexpensive way to join the base to the side wall. The fact is, he never would figure out a way to do it economically.

To the informed designer who is familiar with Alcoa Impacts, this would be just another routine job that he could rely on Alcoa's Impacts experts to knock out for him. In spite of its rather complicated design, it is formed (as are all impacts) in a fraction of a second, with a single stroke of the punch. It is a strong, lightweight, seamless part. Actually made better, stronger and more economically than it could have been

by any other fabricating method.

To guide your thinking, check the handy rules of thumb below. Any part that is a closed-end tubular part, or cup-shaped, should be considered as an Alcoa Impact. In one shot, we can make round, oval, square or special shapes. Ribs, splines, flutes or other functional or decorative patterns can be incorporated on the inside or outside. Let your imagination go to work; we're anxious to go to work for you.

To get your imagination started, send for Alcoa's design manual, *Alcoa Impacts—Metal in Motion*. You'll find it loaded with design tips and ideas that have saved other designers a lot of money. For on-the-spot assistance, call your nearest Alcoa sales office. It's listed under "Aluminum" in the Yellow Pages of your telephone directory. An Alcoa sales engineer will put his solid technical know-how

at your disposal. Aluminum Company of America, 1991-M Alcoa Building, Pittsburgh 19, Pa.

Some Impact Rules of Thumb— Check your problems against this list:

1. Parts requiring hollow sections—either tube or cup-shaped with one end closed.
2. Parts with walls or surfaces requiring zero draft.
3. Parts requiring lengths up to eight or ten times the diameter.
4. Parts requiring the strength of forgings.
5. Parts requiring tolerances down to ± 0.005 ".
6. Parts requiring ribs, bosses or fins as integral parts.
7. Parts requiring low unit cost in mass production. (Often the savings in machining, fabrication and assembly made by impacts amortize tooling in relatively short runs.)

... from engineer
to supervisor ...

To the Editor:

The article "The Transition from Engineer to Supervisor" (MACHINE DESIGN, October 31, 1957) was very timely for my current purposes as an engineering supervisor. Because the general topic was very fresh in my mind, the content of the article was keenly appreciated.

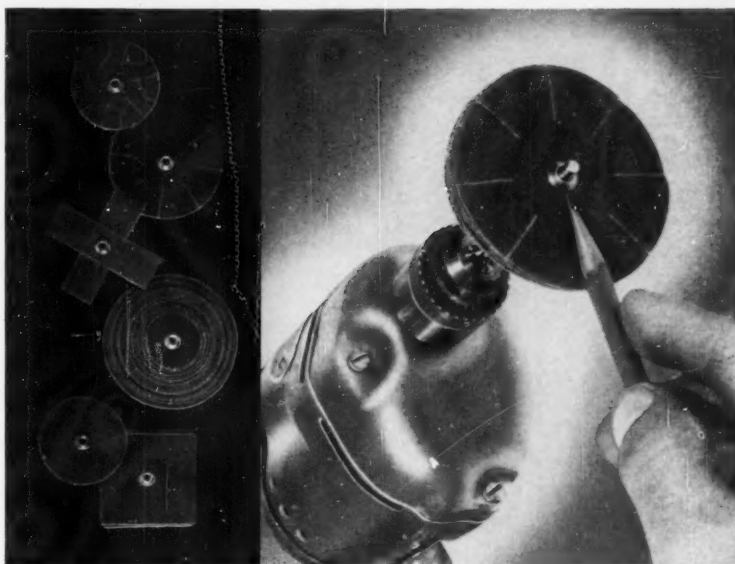

It was encouraging to me to read so much which concurred with what I have been learning and practicing in this field. On the other hand, there are certain differences in opinion which may prove interesting.

1. The point is made, relatively strongly, that the characteristics a man will have as a supervisor are very strongly dependent on what happens to him during the transition period. This is certainly a very critical time in a man's career. However, I like to think that patterns set at this time, while strong, are not really as unchangeable as the content of this article might lead a reader to believe.

Constant Coaching Essential

2. Under "Areas of Training" three areas of proficiency are outlined. A fourth area, one which overlaps the other three, is that of coaching. Much of the literature pertaining to the subject emphasizes that the essence of good administration and supervision lies in the ability of a supervisor to counsel and coach his subordinates. The consistent references to the training function in the remainder of the article shows that the author is well aware of this function, particularly during the transition stage. I suggest consideration of the importance of this function as a constant duty of supervision. Referring to Point 1 above, this training function is the means whereby habits established during transi-

"PERMA-NUTS" GIVE "QUICK-CHANGE" FEATURE TO ABRASIVE ASSEMBLIES

Tubular's PERMA-NUTS AND RIVETERS HELP DAYTON ABRASIVE PRODUCTS, Inc.*

PERMA-NUTS Do Double Duty

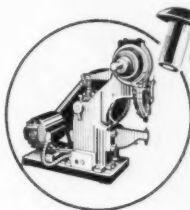

Dayton uses *Tubular's* PERMA-NUTS to permanently fasten its abrasive assemblies and at the same time provide a threaded fitting. This allows the assembly to be quickly spun on or off of a power-tool mandrel and gives the product a special sales advantage. Dayton saves assembly time by using *Tubular's* Riveting Machines. They are made to automatically feed and set PERMA-NUTS.

* DAYTON ABRASIVE of Dayton

Dayton Abrasive Products, Inc., in twelve years has become one of the country's leading manufacturers of abrasive specialties. "Ingenuity," as evidenced by the adaptation of PERMA-NUTS to Dayton's "Spinner Settings®," may be considered a primary ingredient of the company's success.

TUBULAR of Quincy

When fast, automatic, economical, permanent fastening of your assemblies is the problem, turn to *Tubular*. We have the rivets, the machines and the experience. For further information and technical help call our nearest office or send us your blueprint or sample assembly. A special Design Bulletin on PERMA-NUTS is available for the asking.

DRIVE IT WITH A **NEG'ATOR**[®] constant-force spring

Ideal for use as a powerful, constant-torque motor is the NEG'ATOR Spring, the revolutionary constant-force spring component which is giving design engineers new ideas.

They're using the NEG'ATOR Spring as a motor in two ways. A light torque motor is made by winding the NEG'ATOR Spring around two drums of unequal size. The tendency of the material to recur to its *preset curvature* around the smaller drum imparts a constant output torque to the shaft of the larger (output) drum. A more powerful and efficient motor is made as shown above—by *reverse-bending* the free end around the output drum.

Think of how products can be improved, problems solved with a long-running, constant-torque motor. An aircraft designer with a critical counterbalance problem found out. So did a manufacturer of self-retrieving, 50-foot, steel tapes... a motion picture camera maker... an engineer who developed a new precision mechanical computer... many others with drive unit, long deflection, and counterbalancing design problems.

And, so will you when you get the full story. Ask us for a copy of Bulletin 310N, "The Story of the NEG'ATOR Spring." We'll send it immediately without cost.

Professional Viewpoints

tion from engineering to supervision can be modified and possibly sublimated.

3. The points on communications are excellent and well put, in my opinion.

4. Under "Transition to Leadership" reference is made to the fact that "Group Leadership" can be developed only if the characteristics or traits already exist in the individual. The article would have been more acceptable to me if the fact was recognized that these traits basically do exist in everyone, and that those who have the most difficult time becoming good leaders, i.e., in bringing these traits to fruition, may very often be the best leaders. The point here is that anyone who has had many problems in the field of leadership and has overcome them will be most understanding of the problems of others and, therefore, a most effective coach. Second, the effort and drive developed in becoming a good leader the hard way will serve a man well in the art of leadership.

Dealings Require Sincerity

5. In the paragraph concerning "Prior to Promotion," the dialogue relating to the gradual increase of responsibility for the trainee and relating also to "testing the trainee" gave me the feeling that the trainee might, under the circumstances, be subject to criticism as being the fair-haired boy. I believe the subject should be frankly and discreetly discussed with the group. The point that the trainer might ask the trainee to make a decision which already has been inwardly made by the trainer smacks slightly of insincerity. The keenest trainees, and, therefore, most valuable people, will be first to sense any insincerity and perhaps resent the fact that they are being "handled." While the case in point is relatively minor, it brings out a vital necessity of complete, scrupulous sincerity in all dealings of this sort, a point which deserves maximum attention.

6. The points made in the section headed "After the Promotion" were pleasing in the sense that they

How does ESNA's complete line turn your special hex nut requirements into standard parts?

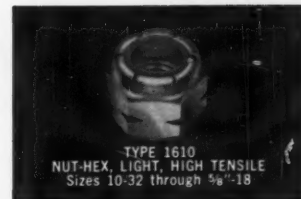

ESNA's line of *standard* hex nuts includes so many hundreds of dimensional, material and tensile variations that, in most instances, a *stock* is available to meet your specific needs.

For example, all the nuts shown here are standard parts. Yet they range in size from a sub-miniature 0-80 thread that is only .107" across the flats to a 4"-4 thread 6-1/8" across. Thread series include SAE, USS and British BSF, BA and Whitworth series. Most are available in carbon steel, stainless, brass and aluminum. They do not gall or seize bolt threads, and they can be re-used many, many times.

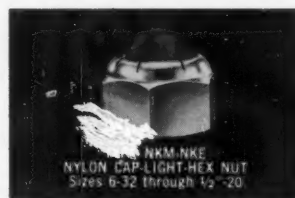

Furthermore, the effectiveness of their red locking collars has been proved by more than thirty years of rugged field service—on locomotives, pile drivers, oil drilling machinery, washing machines, trucks and tractors.

These standard ESNA hex nuts are available from stock or are produced under normal lead times. And, of course, hundreds of other "specials" are also available. For details on the Elastic Stop® nuts shown here, write Dept. N47-124.

Professional Viewpoints

were most pertinent and well put. Some tendency to adopt the technique used in pseudopsychological writing was noted in that the relatively easy to discover things to do or not to do are noted while the more difficult methods for accomplishing these things are not mentioned. This might be the subject of further writing in this field. I refer specifically to the admonishment that a supervisor should "delegate responsibility." I feel sure the author recognizes that this is an art which can be developed by specific procedures.

7. References to various functions of supervision and, in the final paragraphs, to "Leadership" as an art appears to me to be most apt. All arts involve knowledge of the theory plus ample practice in any given field. Management certainly falls into the category of art in this respect. Mention is made of the need for a supervisory trainee to have ample and free opportunity to practice his art. This point has been neglected too often because of the fear that the trainee will make mistakes. The loss to the employer of the training to the supervisory trainee very often more than offsets the cost of mistakes trainees will make, provided, of course, that the trainees are truly ready to supervise.

**... different solutions
can exist harmoniously ...**

To the Editor:

Mr. Jenny's letter was most interesting to me, in that I found his points well taken; however, I might add that we still have differences of opinion on certain points. This seems only natural, since engineering management is an art, not a science. Consequently, different solutions to the same problem can exist harmoniously, since the truth is relative—relative to the situation, or the environment, in which

Why designers specify FLEXLOC self-locking nuts

Where products must be tough . . . must stand up under vibration, shock and abuse . . . designers specify rugged, reliable, precision-built FLEXLOC self-locking nuts as fasteners.

HERE'S WHY:

FLEXLOC locknuts are strong: tensile strengths far exceed accepted standards. They are uniform: carefully manufactured to assure accurate, lasting spring tension in the flexible locking collars. And they are reusable: rough screw threads,

We also manufacture precision titanium fasteners. Write for free booklet.

repeated removal and replacement, frequent adjustments will not affect their locking life.

Standard FLEXLOC self-locking locknuts are available in a wide range of standard sizes and materials, to meet the most critical locknut requirements. Your authorized industrial distributor stocks them. Write us for complete catalog and technical data. Flexloc Locknut Division, STANDARD PRESSED STEEL CO., Jenkintown 18, Pa.

the problem exists.

Most of what I wrote in my article is based on my own experience—both as a trainee and as a trainer. In my opinion, the procedure has been successful; however, it doesn't necessarily follow that it is the only procedure to use and therefore, that it must be vigorously followed.

Points where Mr. Jenny and I differ are:

1. He mentions that he feels that leadership traits "basically do exist in everyone," and that those who have the most difficult time in becoming good leaders may very often be the best leaders. I agree with the second part, since I have found no correlation between the ease or difficulty of transition and ultimate competence. However, I disagree with the first part, since I have had personal experience, in more than one case, with individuals who were basically not suited for supervision.

Selection from Above

2. With reference to the techniques used "Prior to Promotion," I feel that this approach can still be sincere. Basically, the trainee has to realize that he cannot be *given* control of the group until he has *taken* control of the group. I disagree with discussing the selection with the other members of the group. The very structure of the group—having a designated leader—implies that the organization is essentially autocratic, not democratic, and in times of stress this is readily apparent. Primarily, the selection of a leader must come from above *first*, and be followed by consent from below.

In general, it seems to me that we are basically in agreement, though there are some variations. However, were there no variations, there would be no stimulus to discussion, and the subject would be very dull—which it certainly isn't!

THE NATIONAL SCENE

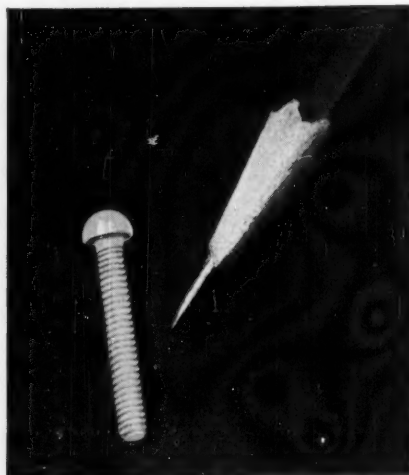

FAMOUS NYLON JOINS NATIONAL'S MATERIALS FAMILY. Proved in thousands of tough applications, versatile Nylon now becomes more useful to the designer than ever. National makes it so in extruded rods and 100% usable finished fabricated parts. Standard rod sizes range from $\frac{1}{4}$ " through 2" in 3 and 6-foot lengths. Inquiries on other sizes and shapes are invited. National's expert engineering counsel assures the commercial soundness and economy of your product. And men, machines and capacity place National in a unique position to serve your immediate needs.

NATIONAL CAN HELP YOU reduce unit product cost or improve product performance at no added cost. Here's why: You can select the "one best material" from over 100 grades of PHENOLITE®, Vulcanized Fibre and NATIONAL Nylon—without compromise in properties or cost. You can simplify production and purchasing with the *timed delivery* of 100%

usable parts—from a single reliable source. You gain competitively with National's new materials and grades—the direct results of programmed materials-research.

You benefit by calling National first. Check Sweet's PD File 2b/Na, the Telephone Directory Yellow Pages, or write Wilmington 99, Delaware, Dept. G-12.

MACHINING SKILL GIVES 100% USABLE PARTS as exemplified by this precision-turned 4-40 thread screw of Nylon. National has the skills and equipment to fabricate almost any part you design. Whether your order requires the simplest punching process or the most complex screw machine operation, you get the same result: 100% usable parts.

INDUSTRY'S BROADEST LINE OF BASIC MATERIALS gives you greatest design freedom. With the addition of Nylon, the National line of materials—already industry's most extensive—grows to more than 100 grades and combinations. These include Vulcanized Fibre and PHENOLITE® Laminated Plastic. The result is greater selectivity for you—unbiased recommendations from National—and virtually any combination of properties you desire.

Nuclear Chemical Engineering. By M. Benedict and T. H. Pigford, both of Massachusetts Institute of Technology; 594 pages, 6 by 9 in., cloth-bound; published by McGraw-Hill Book Co. Inc., 330 West 42nd St., New York 36, N. Y.; available from MACHINE DESIGN, \$9.50 postpaid.

Materials of importance for nuclear reactors, and the novel processes which have been developed to concentrate, purify, and separate these materials are described fully in this volume. Introduction to these materials is by means of the relationship between nuclear reactors and associated production plants. Principles of nuclear physics pertinent to the processing and separation of isotopes are discussed.

Included are sections on the properties, occurrence, concentration, purification, and conversion of uranium, zirconium, hafnium, thorium, and beryllium.

Magnesium Casting Technology. By A. W. Brace and F. A. Allen; 174 pages, 5½ by 8½ in., clothbound; published by and available from Reinhold Publishing Corp., 430 Park Ave., New York 22, N. Y.; \$4.95 per copy.

This book correlates basic principles of magnesium founding and features an objective presentation of both American and British practice.

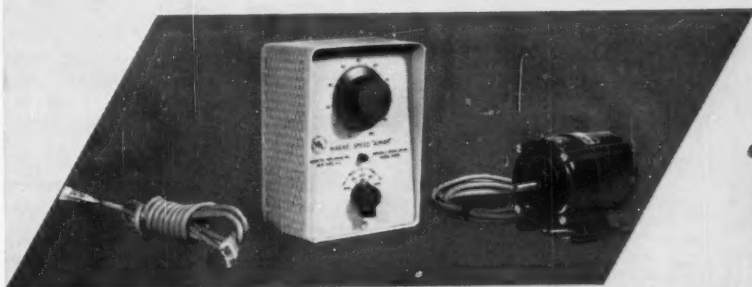

Contents include magnesium casting alloys, melting practice, fundamentals of die design, pressure die-casting, heat treatment of castings, significance of mechanical tests, surface treatment, design characteristics of castings, tolerances, alloy properties, and applications.

Polyethylene. By Theodore O. J. Kresser, Spencer Chemical Co., Kansas City, Mo.; 217 pages, 5 by 7½ in., clothbound; published by and available from Reinhold Publishing

Corp., 430 Park Ave., New York 22, N. Y.; \$4.95 per copy.

This first book of a new plastics applications series treats of the practical aspects of polyethylene including its use, composition, and production.

Applications of polyethylene are treated in a selective manner, and each represents a group of related applications. Topics include general properties of polyethylene, chemical structure, production, processing, film and coating applications, and extrusions.

Transistor Electronics. By David Dewitt and Arthur L. Rossoff; 381 pages, 6 by 9 in., clothbound; published by McGraw-Hill Book Co. Inc., 330 West 42nd St., New York 36, N. Y.; available from MACHINE DESIGN, \$8.00 postpaid.

This book presents the properties of the transistor and its underlying physical mechanisms. It provides step-by-step treatment of transistor circuit design without requiring a previous knowledge of quantum mechanics.

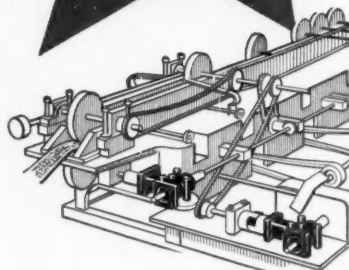

Included are fundamental processes in semiconductors, elementary quantum mechanics, and behavior of carriers within a crystal.

Government Publications

Naval Electronics Laboratory Reliability Design Handbook, PB 121839. 6 sections, 8 by 10 $\frac{1}{2}$ in., paperbound; available from Office of Technical Services, U. S. Dept. of Commerce, Washington 25, D. C., \$3.00 per copy.

This design handbook presents information on ways of achieving simplicity, economy, and reliability in electronic equipment. It is intended to serve as a medium through which information on new materials, processes, techniques, and design aids will be distributed.

The basic volume presents methods of achieving preferred circuitry, construction techniques, design procedures, and application data. Insertion sheets, to be distributed later at frequent intervals, will contain material furnished by NEL engineers, scientists, and other technical personnel on almost any subject related to the preceding topics. Proposed stand-

Simplified drawing based on photo shows ANGLgear application on Texas Inking Machine Co. belt finishing machine. Change from exposed miter gears to ANGLgears solved noise, lubrication and safety problems.

Texas Inking Machine Co., Stafford, Tex., recently developed a machine that automatically polishes and dyes the edges of leather belts. The design involves several 90° drives, and on early models these created problems. "We used exposed miter gears which gave us constant trouble in regard to noise, disengagement, lubrication failures, and the danger of entangling the women operators used so extensively in this industry," Texas' chief engineer recalls. "Now — with ANGLgears — we have a quiet, safe operation and complete confidence in our machine."

Perhaps ANGLgear can solve a 90° power takeoff problem for you. Completely enclosed and permanently lubricated, ANGLgears are available from stock in $\frac{1}{3}$ to 5 hp ratings, with 2 or 3-way shafting, and 1:1 or 2:1 gearing.

Reduce Down Time—Power your Product with Dependable Wagner Motors

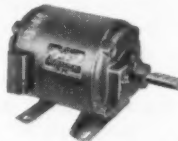

Sixty-six years of experience goes into the building of Wagner Motors. Their reputation for reliability, their electrical characteristics, price and prompt delivery make them a sound choice for your product.

Whatever your motor requirements may be—single-phase or polyphase... $\frac{1}{8}$ or 500 horsepower—Wagner can offer a standard motor that is entirely dependable in its specific application. A few of the many motors in the Wagner line are shown below.

FRACTIONAL HP

TYPE RK — Capacitor-start Induction. For general purpose applications. Single-phase. Rigid or resilient mounting. 48 frame: $\frac{1}{8}$ or $\frac{1}{4}$ hp. 56 frame: $\frac{1}{2}$ through $\frac{3}{4}$ hp. Also available in integral ratings through 5 hp.

TYPE RA — Repulsion-start Induction. For general purpose applications. Single-phase. High starting torque—low starting current. $\frac{1}{8}$ through $\frac{3}{4}$ hp. Also available in integral ratings through 15 hp.

TYPE RB — Split-phase Induction. For easy starting applications. Single-phase, resilient mounting. 48 frame: $\frac{1}{8}$, $\frac{1}{4}$ or $\frac{1}{2}$ hp.

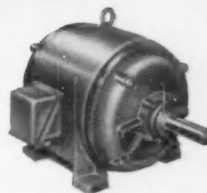

TYPE RP — Polyphase Squirrel-cage Induction. General purpose, normal torque. 56 frame: $\frac{1}{4}$ through $\frac{3}{4}$ hp.

INTEGRAL HP

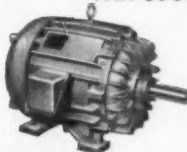

DRIP-PROOF

TYPE DP—Squirrel-cage Induction, corrosion resistant cast iron frames. 1 through 125 horsepower.

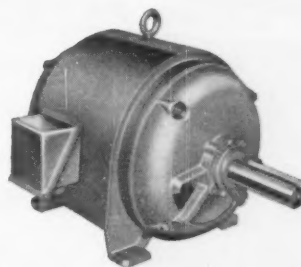

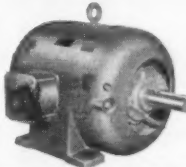

TOTALLY ENCLOSED FAN-COOLED

TYPES EP AND JP

Standard and explosion-proof. Squirrel-cage Induction, corrosion resistant cast iron ribbed frames, 1 through 30 hp—smooth frames, 40 through 250 hp.

OPEN TYPE POLYPHASE SQUIRREL CAGE

TYPE RP—Drip-proof. Suitable for all general purpose applications. Available in ratings 150 through 500 hp.

OTHER WAGNER MOTORS

In addition to a complete line of standard motors, Wagner also furnishes Increment Type Motor and Starter Combinations... Wound Rotor Polyphase Motors... Jet Pump Motors... Vertical and Flange Mounted Motors... Hermetic Motors... Gear Motors and Direct-Current Motors. Consult the nearest of our 32 branch offices, or mail coupon today for full information on the complete Wagner line.

ards will be included.

Major topics of the basic book include equipment design; environmental, electrical, and mechanical considerations; materials, circuits, tubes, and electromechanical components.

Screw-Thread Standards For Federal Services, 1957. 208 pages, 7 $\frac{1}{4}$ by 10 $\frac{1}{4}$ in., paperbound; available from Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C.; \$1.25 per copy.

This publication represents the work of the Interdepartmental Screw Thread Committee, sponsored by the Departments of Defense, Army, Navy, Air Force, and Commerce to promote uniformity in screw-thread standards in Departments concerned.

Current work will be issued in three volumes or parts; this volume, Part 1, contains six sections covering definition of terms relating to size, fit and dimensions of screw threads, form and thread series for bolts, special diameters, miniature screw threads, and gaging for Unified, American, and American National threads. Part 2 will include standards for hose-coupling, pipe, and gas cylinder threads and will be issued when the revised standards have been completely formulated. This will be followed by Part 3, which will include Acme, Sub-Acme, Buttress, and other standard threads.

Investigations of Alloys of Magnesium and Their Properties, WADO Technical Report 56-88, PB 121801. By Foerster, Couling, Baker, and Johnson, all of The Dow Chemical Company; 84 pages, 8 $\frac{1}{4}$ by 10 $\frac{1}{4}$ in., paperbound; published by Wright Air Development Center; available from Office of Technical Services, U. S. Dept. of Commerce, Washington 25, D. C.; \$2.50 per copy.

Three separate major studies on magnesium alloys are discussed in this report. The first deals with development of improved wrought alloys, the second with thermal and electrical properties of the alloys, and the third with plastic deformation and preferred orientation of wrought alloys.

Topics include chemical analysis

THE *Simplest answer* TO BEARING PROBLEMS

Bunting capability and leadership in the field of Cast Bronze Bearings and parts are well established and widely recognized. Today Bunting offers an equally comprehensive and responsible service in the field of Sintered Powdered Metal Bearings and parts.

Bunting's special knowledge and facilities make Sintered Powdered Metal products available in many applications not heretofore considered feasible. We can help you find the simplest answer to your individual problem, be it Cast Bronze or Sintered Metal.

A wide range of stock sizes of Bunting Cast Bronze and Sintered Powdered Bronze self-lubricating, plain and flange bearings, thrust bearings and bars are available from Bunting distributors everywhere in America.

Write for catalogs and your copy of the new 24 page Bunting Engineering handbook of Sintered Powdered products and their composition, manufacture and application.

of magnesium alloys, properties of sheet and extrusions, creep strength and corrosion resistance of extrusions, pellet alloys, room-temperature properties of pellet extruded high-temperature alloys, mechanical twinning in cold rolling, and data on simultaneous measurement of thermal and electrical conductivity.

Atomic Energy Facts. 216 pages, 8 by 10½ in., paperbound; available from Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C.; \$2.00 per copy.

Devoted entirely to peaceful uses of atomic energy, this book describes the organization and functions of the AEC, technical information services offered by the Commission, conditions under which qualified individuals and organizations may gain access to classified information, and how to obtain licenses and patents.

Other discussions cover the Commission's programs for training and education in nuclear science and technology, activities of major AEC contractors, raw and feed materials, reactor developments, and radioisotope development. Eight appendices cover principles of controlled thermonuclear programs, categories of restricted data available to access permit holders, depository libraries of AEC, reactor data tables, and a catalog of materials standards.

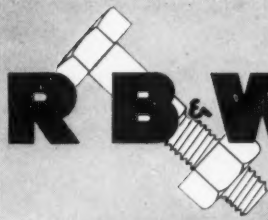

Alumina-Base Cermets, WADO Technical Report 54-173. By Charles A. Hauch, Ernest W. Deadwyler, and Thomas S. Sherlin, all of the Ohio State University Research Foundation; 8¼ by 10¼ in., paperbound; published by Wright Air Development Center; available from Office of Technical Services, U. S. Dept. of Commerce, Washington 25, D. C.;

PB 121253, Part 2—37 pages; \$1.25 per copy.

PB 121461, Part 3—39 pages; \$1.25 per copy.

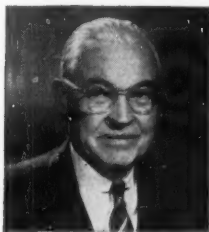

This report presents results of studies on five new alumina-base cermets in which metal contents range from 50 to 95 per cent by volume.

Alloys investigated include 80 Ni, 20 Cr; 65 Co, 30 Cr, 5 Mo; 66

FASTENER BRIEFS

RUSSELL, BURDSALL & WARD BOLT AND NUT COMPANY

Technical-ities

By John S. Davey

Fastener coatings

Salt spray testing of various metallic coatings used on fasteners doesn't always give a true picture. In actual service, accelerated test results are not always borne out.

Reason: The tests favor the coatings which can endure continuous moisture and salt atmospheres, whereas some do better under the normal intermittent dry and wet conditions of weathering.

Experience has developed a "scale" of suitability of various coatings for fastener protection.

FOR RUST PROTECTION

Hot galvanizing offers greatest endurance under most conditions. It falls short on highly stressed fasteners.

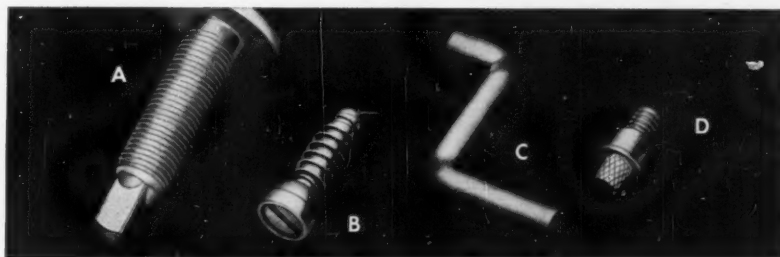

Electrodeposited zinc is next most practical—providing good appearance, controlled tolerance at threads, and ability to take high bolt tensions.

Cadmium plate stands out where salt atmospheres predominate. Not suitable for contact with edibles, it is ruled out for many appliances.

For general applications, the rust prevention of black oxide coatings proves satisfactory. Phosphate coatings, too, offer some degree of protection, but not under severe conditions.

Chromium, plated over copper, should be considered more for its appearance on fasteners rather than protection.

Cold heading creates quality parts the low cost way

No value analysis of product components is really complete without exploring what cold heading machines can do to cut costs. Some examples:

A. ELIMINATE EXTRA OPERATIONS. Leveling screw, formerly made by riveting flat disc to set screw, now emerges as a stronger, single piece from a cold header.

B. ONE PIECE BETTER THAN TWO. Cold headed hose clamp screw has integral flange which, after head is slotted, is forced up to form screw-driver shield. Before, piece was in two parts . . . with screw made on screw machine, and the shield a stamping fitted around head during assembly.

C. FASTER THAN FORGING. Shifter lever is bent into double "L" automatically in bolt header . . . replacing

ing 2-stage forging operation. The header does it at high speed from continuous rod.

D. METAL FLOWS TO SHAPE—NO WASTE. No longer cut on screw machine, insert screw for plastic parts costs 40% less. Cold header uses just the amount of metal required. The threading and knurling, too, are done automatically at high speed.

Metal forced to cold flow into shape results not only in savings but also in stronger parts. With uncut flow lines, the piece is better able to withstand stress concentrations.

For an expert opinion on parts you now use, check with Russell, Burdsall & Ward Bolt and Nut Company, Port Chester, New York.

Plants at: Port Chester, N. Y.; Coraopolis, Pa.; Rock Falls, Ill.; Los Angeles, Calif. Additional sales offices at: Ardmore (Phila.), Pa.; Pittsburgh; Detroit; Chicago; Dallas; San Francisco.

12-point fasteners cut wrench clearance space

Double hex RB&W bolts and nuts measure smaller across their points than single hex fasteners. Used with an external socket wrench, they permit optimum driving torque to be applied.

Thus, while permitting design of more compact assemblies, these fasteners also assure proper preloading for stronger connections.

Available with plain flange, or SPIN-LOCK design which incorporates teeth that embed upon tightening and resist loosening under vibration or temperature changes.

HIGH CAPACITY SWITCH

Controls
up to 4
circuits

DUST, OIL TIGHT
LONG LIFE
VERSATILE
LONG OVERTRAVEL

Machine tool and other equipment applications are "naturals" for this Acro high capacity switch, which can control up to four separate circuits on either pilot or line duty. Actuator is adjustable 360° in two planes.

ELECTRICAL RATING

2 H.P. 230 Volts A.C.
1 H.P. 115 Volts A.C.
20 Amps—250 Volts A.C.

Two types available: Double Action Type actuates switch contacts when actuator is moved either side of "at rest" position. Single Action Type operates from one side of "at rest" position only. Both are designed for long life under heavy use.

Nuclear Reactor Materials
Special Nonferrous Alloys
Alloys for Investment Casting
Soft Magnetic Alloys

FROM VACUUM METALS...

new alloys impossible to produce
by conventional methods

NUCLEAR POWER applications have created demands for entirely new types of materials. A good example is borated stainless steel—a metal whose high neutron cross-section is important for shielding and control rods. Conventional air-melting, however, limits the boron content to 1%. But Vacuum Metals is producing *fully workable* stainless alloys with 2% boron—even higher percentages experimentally.

Vacuum melting makes possible the production of such contemporary alloys with extremely low impurity content—impurities that are detrimental to nuclear reactor performance. On the other hand, with vacuum melting, materials can be removed, too. For example,

Vacuum Metals produces stainless steels with no Silicon or Manganese, and extremely low Cobalt and other elements.

Vacuum Metals Corporation, Division of Crucible Steel Company of America, is the first and largest producer of vacuum-induction melted metals. And VMC produces a wider variety of alloys than any other company. Furthermore, it is now doubling its capacity, to meet increasing industrial demands for these interesting materials. For details on how a vacuum-melted metal may help you solve a tough metal problem, write, giving as much data as possible, to *Vacuum Metals Corporation, Division of Crucible Steel Company of America, P. O. Box 977, Syracuse 1, N. Y.*

Now in mass production...

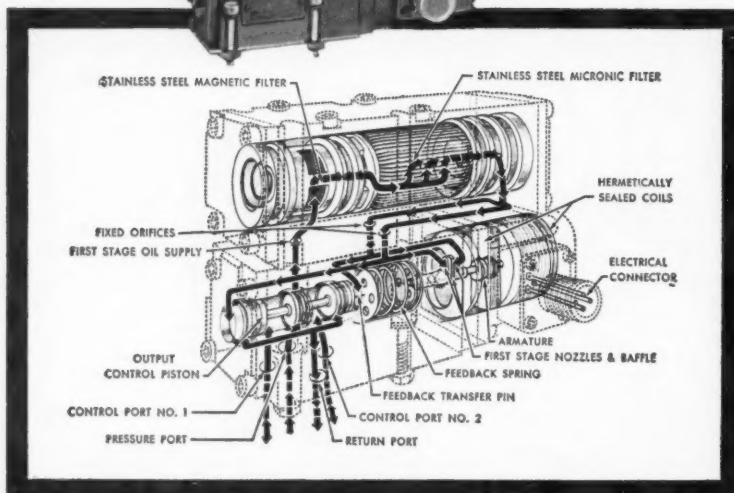

SANDERS SA-19 SERVO VALVE

The Sanders SA-19 Servo Valve provides unparalleled efficiency and reliability for a wide variety of electro-hydraulic components and systems. Utilizing the Sanders internal force feedback principle, this two-stage electro-hydraulic amplifier develops large hydraulic output flows with relatively low input electrical power requirements.

Features include ▶

- Excellent Resolution
- High Power Amplification
- Low Hysteresis
- Low Threshold
- Low Input Power
- Wide Frequency Response
- High Stiffness of Control
- Built-in Filtration

Operation: An input current, converted to a magnetic force in the First Stage Armature, moves the First Stage Baffle between two nozzles causing a pressure differential across the ends of the Output Control Piston. The resulting motion of the Output Control Piston is fed back through the Transfer Pin and Feedback Spring as a restoring force on the First Stage Armature, thus nulling the valve and porting oil to the load. The First Stage Oil Supply is thoroughly filtered as shown.

TYPICAL SPECIFICATIONS:

Coil Resistance (ohms/coil) 3000	Amplitude Ratio within 3 db at 100 cps
Differential Current ± 20 ma	Phase Shift 90° at 100 cps
Flow (GPM @ 1000 psi across valve) 8	Resolution (% of Full Signal) ± 0.2
System Pressure (psi) 3000	Hysteresis (% of Full Signal) ± 3.0

OPERATING HOURS

with only Minor Adjustments

with this 400 amp.

WISCONSIN-POWERED WELDER

On-the-job service is what counts most in an engine. Here, for example, is a brief summary of a service report covering the performance of the Model VR4D 56 hp. Wisconsin Heavy-Duty AIR-COOLED Power Unit which drives the 400 Ampere Arc Welder illustrated above:

"Has operated exceedingly well . . . approximately 3143 operating hours . . . maintenance has been negligible after a few minor adjustments; appreciate fact that servicing is so simple; we are free of anti-freeze . . . no fooling with gadgets of water-cooled engines."

This is another typical case of outstanding service delivered by Wisconsin Heavy-Duty Air-Cooled Engines on many kinds of equipment. Basic load-holding High Torque, heavy-duty design and construction in all details, foolproof all-weather Air-Cooling and *exclusive specialization* in the design and manufacture of AIR-COOLED Engines are some of the factors that are responsible for Wisconsin Engine preference wherever dependable, economical power is required.

You can't do better than to specify "Wisconsin Power" for your equipment. Write for Wisconsin Engine Bulletin S-212.

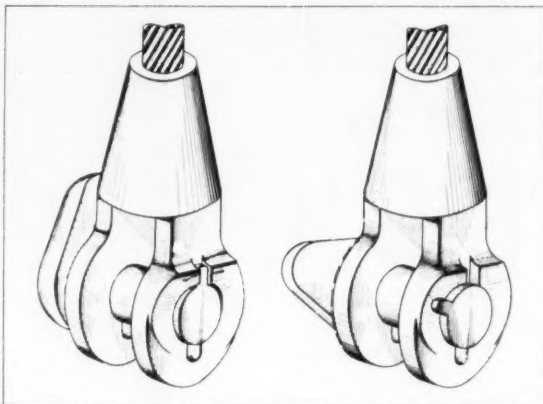

NOTEWORTHY

Patents

Spring-Locking Clevis

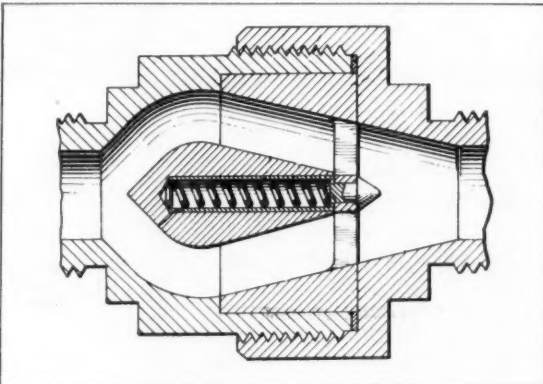

Spring force is released from the locking pin of a safety clevis when the latch-lug engages the latch recess. Design facilitates the release of larger size clevises employing substantial spring loadings. Pin

is free to be withdrawn from the saddle when the lug is rotated to align with the pass-through notches. During assembly of the clevis, rotation of the palm knob forces the locking lug up the cam surface (right), compressing the spring washer and allowing the lug to snap into its recess. *Patent 2,809,856 assigned to George E. Failing Co. by Emmett L. Alexander.*

Cushioned-Action Check Valve

Minimum flow restriction is provided by a tear-drop shaped poppet and contoured flow-passage walls in a check valve with cushioned action. Light coil spring biases poppet to the closed position; fluid flow (left to right) moves poppet to open position. Air

Want to SAVE up to 70% of heating costs on your phosphate coating line?

new Parker *Cold Bonderite System does it!*

Turn down the heat! Put most of your Bonderite line heat costs back in the till! Parker Rust Proof Company has developed a new Bonderite system for low temperature operation.

It includes a new cold alkaline cleaner that works beautifully at 70° and is effective in a temperature range from 60° to 120°. A new Spra-Bonderite, specially formulated to produce a superior coating at low temperatures, has been developed to work in conjunction with the new Parker cold cleaner.

With the new cold Bonderite system, savings are really sizable. Heat consumption in the line is cut by as much as 70%. Cost of the new Parker system is approximately equal to conventional alkali cleaners and

phosphate coating chemicals, so the savings in heat are practically all velvet. It is estimated that on an average automobile body line the savings in steam costs can run as high as 10 to 12 cents per body; on an average refrigerator line 4 to 5 cents per cabinet. Savings in B.T.U.s can mean savings in dollars.

The new cold Bonderite system has been production-tested in mass production plants. Its performance has amazed the experts. It's ready to go to work in your plant, saving you money, right now!

Why go on paying for heat you don't need? Start using Parker's new cold Bonderite system. A letter or phone call will bring a Parker man with full, money-saving details.

cost-saving tips on SPECIAL SCREWS

- 1** **USE STANDARD SCREWS IF POSSIBLE.** Save money by designing the job to the screw. Use specials only where absolutely required.
- 2** **DETERMINE YOUR APPLICATION REQUIREMENTS.** Over-design and under-design both waste money.
- 3** **CONSULT A FASTENING SPECIALIST.** Do this before finalizing your design. His suggestions may lead to a simpler, lower-cost answer.
- 4** **DON'T MAKE SPECIALS YOURSELF.** It actually costs less to use a dependable, experienced screw manufacturer. No hidden costs, no tie-up of your valuable men and machines.
- 5** **BUY FROM YOUR INDUSTRIAL DISTRIBUTOR.** He can expedite delivery, provide valuable local services and is convenient for re-ordering.

■ Your most dependable source for special screws is *Mac-it*. Production flexibility assures maximum quality at lowest cost; engineering assistance is always available; personal attention to each order by craftsmen means exact compliance with your blueprint specifications.

For finest service and fastest delivery on orders for one or 100,000 "specials", contact your local *Mac-it* distributor or: Mac-it Screw Division, Strong, Carlisle & Hammond, 1392 West 3rd Street, Cleveland 13, Ohio.

Noteworthy Patents

pocketed in clearance between the end of the poppet-support stem and the poppet bore escapes slowly as valve opens and re-enters as the valve closes. Result is to provide a dash-pot action which stops vibration and chattering of the poppet on its seat. *Patent 2,809,660 assigned to Aeroquip Corp. by Alvin Louis Becker.*

Vibration-Absorbing Fan Mounting

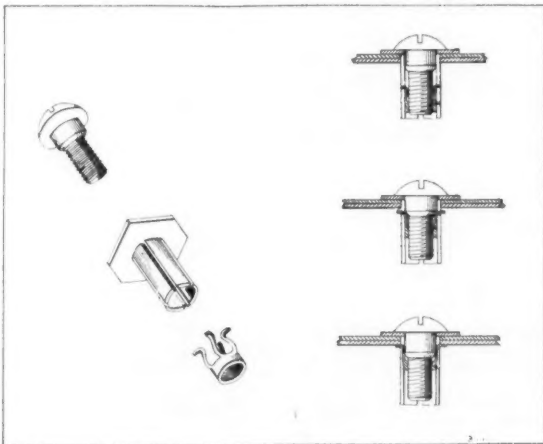

Rubber rings, bonded to formed retaining covers, damp out vibration transmitted from fan blades to hub in a compressed-rubber fan-mounting design. Be-

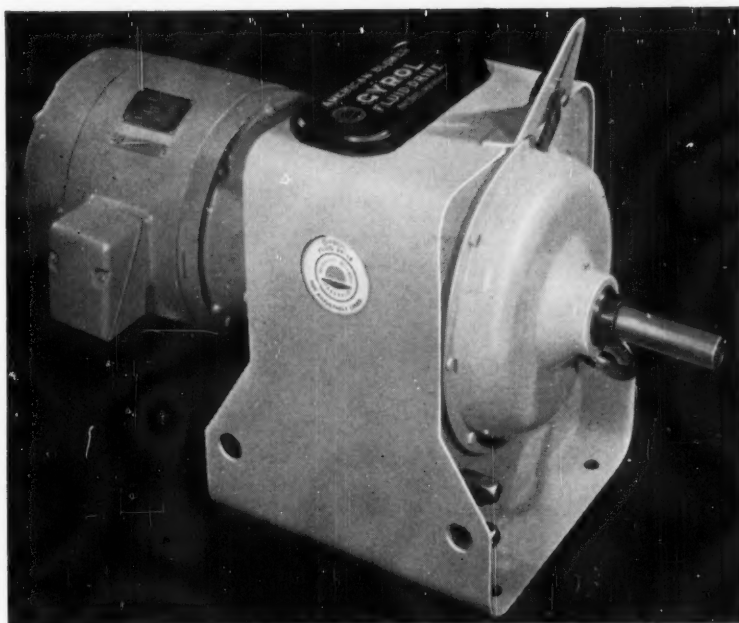

cause flexible elements are constrained against radial expansion during clamping (right to left), blades and hub are maintained in concentric alignment. Tilting of the fan during operation is prevented by bronze rings which ride on the steel hub. *Patent 2,802,353 assigned to H. A. King Co. by Thomas H. Peirce.*

Blind Fastener

Blind fastening of materials of varying thickness can be accomplished by means of an expanding fastener. Comprising bolt, sleeve and nut sections (left),

Why you should include Gýrol® Fluid Drives in your plans for automation

Compact, flange-mounted Type VS, Class 2 Gýrol Fluid Drive — 1 to 25 hp.

For one thing, Gýrol Fluid Drives provide adjustable, *stepless* speed control of driven machinery, using *standard*, constant-speed motors — without complicated electric circuits or starting devices.

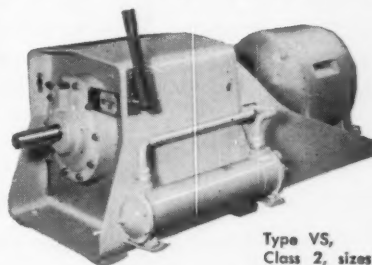

Adaptable to remote, manual, or automatic speed control, Gýrol Fluid Drives are compact, self-contained units — requiring only the conventional flexible-coupling connections to the motor and load. They provide complete shock absorption, are easy to install in a variety of arrangements of driving to driven machinery. Why not call our nearest branch for full details today?

Typical Applications

PUMPS, AGITATORS, MIXERS
CONVEYORS, CABLE &
ROPE MACHINERY
FANS AND BLOWERS
CENTRIFUGAL COMPRESSORS
PAPER AND PRINTING MACHINERY
TEXTILE MACHINERY

Complete range of sizes — 1 hp to 12,000 hp

The Gýrol Fluid Drive line includes a complete range of sizes, from 1 to 12,000 hp. All save power through lower horsepower requirements. A minimum number of wear points cuts maintenance. And, because Gýrol Fluid Drives bring about reduced speeds and pressures, driven equipment lasts longer.

Type VS,
Class 2, sizes
7½ to 800 hp.

NOISE Bothers The Patient As Well As The Drilling

Scott Sound Level Meter Aids
The S. S. White Dental Mfg. Company
To Produce a Quieter Dental Instrument

The Noise of modern high-speed dental equipment can be very annoying to patients. White's engineers use the Scott 410-C Sound Level Meter in production testing of their new ball-bearing hand piece to insure that the noise of finished instruments does not exceed the standard set for them.

Completely Portable Sound Level Meter Helps YOU Design A Quieter Product

A quiet product gives you an important sales advantage. H. H. Scott's sound Level Meter, and Sound Analyzer can help you locate, measure and minimize noise and vibration. Here are important features of the Scott Sound Level Meter and Sound Analyzer.

- Sound Level Meter is flash-light size weighing only 2 lb. 7 oz. Sound analyzer is only 10" x 10" x 6".
- Extreme portability and battery power of these instruments makes them easy to set up and use in field measurements.
- Both instruments meet all applicable

standards of the American Standards Association.

- Sound Analyzer has Passband adjustable in half octaves for more precise measurements.
- Sound Level Meter received the Electrical Manufacturing Award for outstanding design.

Fact

worth considering

Wouldn't a ball
solve
our problem?

Right...
and do you realize
it's the least expensive
high precision
component available.

How right these engineers are, for the modern Hartford Ball is an extremely high precision component that costs very little for the myriad of important jobs it performs.

For example, a 3/16" Hartford high chrome alloy (Standard Grade No. 1)

ball costs less than 1/2 cent, yet, it is perfectly spherical to within 25 millionths of an inch and with a surface finish of better than one micro inch, R. M. S.

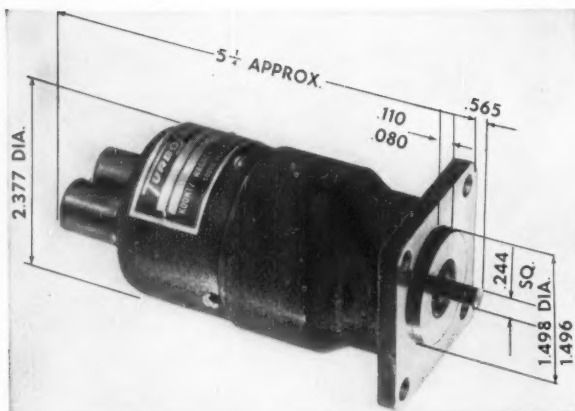

Hartford's Look Ahead Policy continually expands your potential use for balls through the development of a large range of sizes and grades in many materials, both standard and special. A copy of Hartford's new technical guide to the selection of balls is yours for the asking.

For Speed Switching . . .

. . . the *Turbo-Switch* keeps an electric circuit energized or deenergized between a range of driving unit speeds. An example of the precise electro-mechanical devices developed by Koontz-Wagner, this switch has a unique sealed hydraulic coupling transmitting rotation to the switch. Operating up to 160° F. ambient with contacts rated at 10 amps. at 125 or 250 volts AC this switch can be set to operate at any point up to 3500 rpm. Get full details on this and other K-W valves, solenoid and switch developments from:

CLOSURES

- Metal or Plastic Caps or Plugs to protect threads, tubes, machined parts, reamers, cutters, tools.
 - Protect against thread damage, dust, dirt, and moisture.
 - For inside and outside application.
- All sizes. Immediate delivery.**

Clover closures are made in metal and tough plastic polyethylene. They are made in caps, plugs and special shapes to fit parts tightly, offering completely sealed protection during manufacture, shipping and storage. Backed by years of closure experience. Write for low prices and complete information.

Send coupon today!

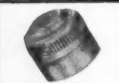

Gentlemen:

Please send samples and prices of closures in
Polyethylene ☐ Aluminum ☐

Young 3-1-2 COOLING SYSTEM TREATMENT

Rust and Corrosion Inhibitor

Young 3-1-2 is a complete protective treatment for the cooling systems of diesel, gas and gasoline internal combustion engines. It prevents rust, controls scale, and protects aluminum, copper, ferrous metals, etc., from corrosion; and non-metals from deterioration.

Young 3-1-2 is furnished in pellet form, and since it is a *non-chromate* type treatment, it is non-irritating to the skin. No weighing or measuring is required: 3 pellets to 1 gallon of coolant, 2 times a year (under normal operating conditions) are recommended.

Young 3-1-2 will not deteriorate with age when stored in a dry area. It is compatible with all types of standard anti-freezes.

Top Tube Performance can
cost up to 40% less:

specify

ALCOA UTILITUBE

for fuel, air, hydraulic
and oil lines

ALCOA® UTILITUBE, the coiled aluminum tube, actually costs as much as 40% less per foot than copper tube.

That saving becomes more important when you realize that it comes with no sacrifice in performance and quality. You can count on ALCOA UTILITUBE for dependable service in fuel, air, gas and hydraulic lines. Here's why:

LONG LENGTHS—available in economical lengths up to 1,000 feet.

EASY WORKABILITY—bends easily, work-hardens less.

HIGH FATIGUE STRENGTH—stands up well under vibration.

CORROSION RESISTANT—resists most industrial atmospheres, many gases and liquids.

LIGHT WEIGHT— $\frac{1}{3}$ weight of copper; long lengths easier to handle.

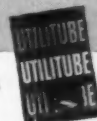

NO SLUDGE OR GUM—will not contribute to the formation of sludge or gum in lubricating oils, gasoline.

AVAILABILITY—your distributor carries ALCOA UTILITUBE in stock.

FITTINGS—readily available in aluminum from several manufacturers.

Get dependable tube service for less: Specify *Alcoa Utilitube* for your coiled tube needs. Use the coupon to get complete details in the FREE BOOKLET, *Alcoa Utilitube*.

when you design
Flexible Bearings
by Bushings, Inc. **in...**

**you design noise,
vibration, shock
and shaft-wear out!**

*Custom fabrication by Bushings, Inc.
can assist in solving your bearing problems*

Whatever you design or manufacture with moving parts—from small appliances to heavy earth moving equipment—you can overcome excess noise, vibration, shaft-wear, misalignment and similar problems by designing Flexible Bearings by Bushings, Inc. IN as original equipment.

FLEXIBLE BEARINGS are custom-fabricated to your specifications. With the bushing manufactured to fit the job, you are no longer restricted to limited "stock" sizes but have complete freedom of design.

FLEXIBLE BEARINGS by Bushings, Inc. have a mechanical bond between the flexing medium and the inner and outer members.

FLEXIBLE BEARINGS by Bushings, Inc. are available in two types: **TORSIONAL** for oscillating movement; **PROTECTIVE** for insulating ball, needle and other types of bearings against load, sudden shock, misalignment or noise transmission.

If you want fast, authoritative engineering help on your bearing problems, write Harvey G. Moore at the address below.

For more than 15 years
Bushings, Inc. has custom-
fabricated bearings in a
wide range of metals and
sizes for hundreds of
different manufacturers.

**VIBRO-LEVELER
MOUNTS** dampen
vibration, permit
precision leveling
of machines.

**SILENT-LIGN
PILLOW BLOCKS** for
shaft mounting. Has
all Flexible Bearing
features.

LOOK AT**

BEVEL GEARS

Designers can now re-consider the use of bevel gears—due to the latest Gleason coniflex system of bevel gear proportions which we employ—to minimize gear mounting problems and for less trouble after assembly. Costs are less by this method, better finishes and smoother gear operations are a result, and because bevel gears are so efficient, they can now be used more extensively than ever before.

We can make bevel gears up to 3" in diameter with up to 16 diametral pitch for such products as instruments, power tools, differentials, appliances, and fishing reels. Process bevel gears are precision engineered, deliveries are prompt.

Send blue prints or specs for
prompt estimates to the special-
ists in the Fine Pitch Field.

who makes long-lasting
 rubber O-rings
 of $\pm .002''$ tolerance
 at low cost?

minnesota rubber
 and gasket company

compression molded

injection molded

Minnesota Rubber O-rings are injection molded by the exclusive Minnesota Rubber process. Result is increased resistance to abrasions and chemical actions due to consistent, unequalled high density. Evidence of the greater density of injection molding is shown here in cross sections of Standard Buna N compound, .026" x .019", magnified 240 diameters by University of Minn.

In addition, Minnesota Rubber's O-rings have no flash. Tolerances can be kept within $\pm .002$ inch. Cost? M.R. O-rings cost as little as ordinary O-rings! And M.R.'s 100% inspection and quality control save you additional money in replacement costs, too.

DIRECTION OF CONTROL

FLUID CONTROL
VALVES

CLAMP CONNECTION

SPRING CONTROL for
Single Acting Cylinder

CLAMP CONNECTION

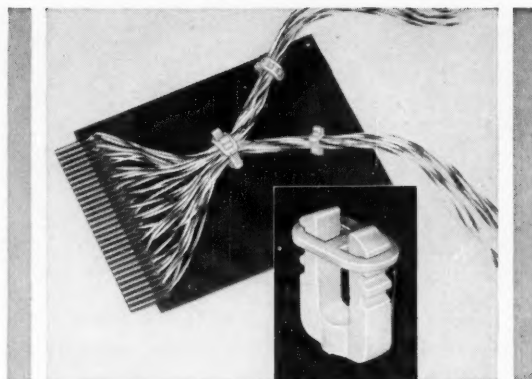

Pneu-Trol Speed Control Valves, are widely used in hundreds of control applications because they combine in a short, compact body, a tapered fine thread needle for extremely accurate air or oil flow control and a floating retro ball check, which permits full flow in the opposite direction. Retro ball floats in most sensitive position to its seat, requiring only a slight differential pressure to fully open or close it.

Needle design permits maximum flow capacity in the controlled direction. Metal to metal needle and ball seats insure long trouble-free service. Simple, practical "O" gland structure eliminates troublesome leaking. Valve bodies machined from hex brass or aluminum for 2000 psi working pressures; steel and stainless steel for 5000 psi. Made in 5 female pipe sizes— $\frac{1}{8}$ " to $\frac{3}{4}$ ". ATTRACTIVE PRICES . . . IMMEDIATE DELIVERY.

Write for illustrated circular and prices.

ENGINEERS AVAILABLE OR WANTED

WANTED: Are you happy as a "member of the team"? If not, we suggest that you consider an opening which we have for a project engineer. We manufacture and sell highway safety materials and equipment and need a mechanical engineer who has lots of ideas to work out a number of interesting projects that need solutions. If you feel you would be interested in this work and would like to participate as an individual in a small company of friendly people, we invite your inquiry into this opportunity. Wald Industries, Incorporated, Ask for Mr. Wald or Mr. Wilson, Huntingdon, Pennsylvania, Phone - 1272.

AVAILABLE: Senior Mechanical Design Engineer for board work. High grade draftsmanship. Superior ability on design of machinery, product, power press dies, production tools. Originality on new developments. Any location and length of engagement. Address Boxholder, 202 Back Bay Postal Annex, Boston, Massachusetts.

AVAILABLE: Sales Engineering, Management. Young aggressive Mechanical Engineer, (age 31) with experience in production supervision, equipment erection, plant engineering, machine design and control design desires challenging opportunity with progressive concern. If you have need for ambition, capability and industry please contact for resume. Address Box 924, MACHINE DESIGN, Penton Bldg., Cleveland 13, Ohio.

WANTED: Chief Engineer, Machine Design. Aggressive, creative midwestern manufacturer of mechanical power transmission equipment has attractive executive position for practical, mechanical engineer whose ability to deliver can match company's. Strong financial condition and excellent nationwide distributive system demands that this publicly-owned company keep engineering "ahead of the parade". The man who qualifies holds an ME degree and has a minimum of ten years experience in the design of transmissions and machinery. He should be able to justify a \$20,000 starting salary, with usual extras. Address Box 925, MACHINE DESIGN, Penton Bldg., Cleveland 13, Ohio.

MACHINE DESIGN is sent at no cost to management, design and engineering personnel whose work involves design engineering of machines, appliances, electrical and mechanical equipment, in U.S. and Canadian companies employing 20 or more people. Copies are sent on the basis of one for each group of four or five readers. Consulting and industrial engineering firms, research institutions and U.S. government installations, performing design engineering of products are also eligible.

Subscription in United States, possessions, and Canada for home-addressed copies and copies not qualified under above rules: One year, \$10. Single copies \$1.00. Other countries: One year, \$25. Published every other Thursday and copyrighted 1957 by Penton Publishing Co., Penton Bldg., Cleveland 13, Ohio. Accepted as Controlled Circulation publication at Cleveland, Ohio.

...this is OPPORTUNITY!

Work with AC on some of the most exciting and important projects now under way for our armed forces — the whole field of electronics and the production of electronic equipment for jet engines and for guided missiles.

...this is SECURITY!

General Motors offers greater security and more benefits to employees. GM offers the widest variety of opportunities and the chance for individuals to grow with the company and within the company.

...this may be FOR YOU!

If you hold an engineering degree and have an electrical, mechanical or electronic background, please contact us. Check the AC product list below. There are opportunities in the engineering departments now working on any of these projects . . . or on others that are now in the research and development stage.

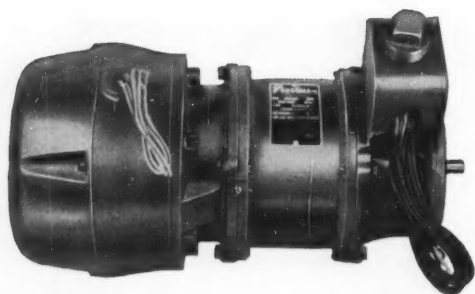

Write Mr. Cecil Sundeen, Supervisor of Technical Employment, in care of . . .

SPECIAL MOUNTED VERTICAL MOTOR

If stock motors cut machine efficiency see *Peerless*

Peerless builds a complete line of general purpose motors as well as hundreds of specials designed to meet specific needs. Our engineers have wide experience in applications of all types, and specialize in solving motor problems for design engineers who require unusual mountings or unusual construction to achieve maximum machine efficiency. Consult your nearby Peerless representative or write directly to us about any motor problem. We'll work with you to develop the one motor that powers your equipment best. Write for Bulletin SDA-155 now.

You get automatic foolproof lubrication with **LUBRIVAL** circulating oil system

FARVAL—
*Studies in
Centralized
Lubrication*
No. 207

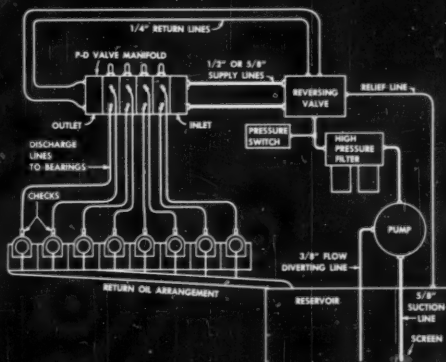

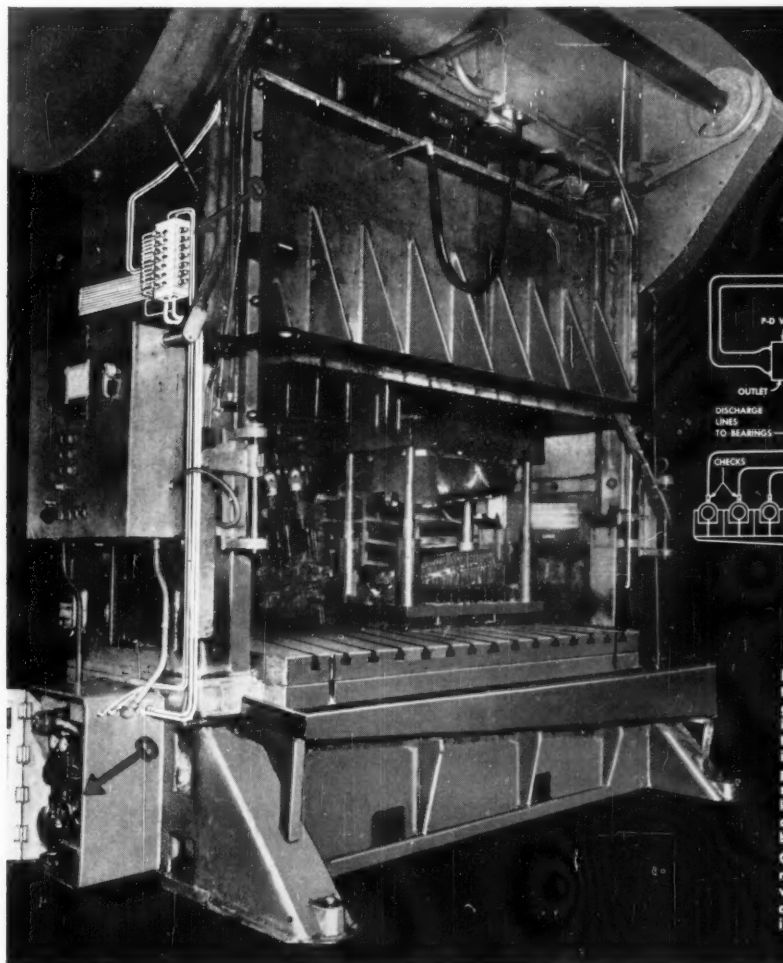

Diagram above shows components of a typical LUBRIVAL system—a manifolded group of four Progressive Dualine measuring valves at top, with lines discharging to eight bearings below. Other components indicated are variable delivery pump, high pressure dual filter, high-low pressure switch, reversing valve and oil supply lines. Return oil lines and reservoir indicated are to be supplied by equipment builder or user.

On press shown at left may be seen a manifolded group of seven LUBRIVAL valves, with other system components in a cabinet below. Oil reservoir is located inside press base.

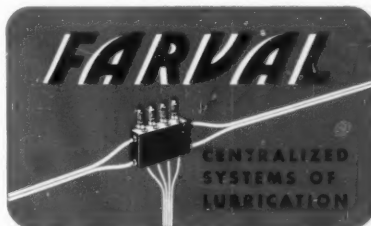

● The bearings of this 150-ton metal stamping press and others of its type are now protected by LUBRIVAL. This new Farval system for circulating oil is being installed on many varied kinds of machine tools, presses, automated machines, and other equipment calling for circulating oil lubrication.

Employing the famous Dualine principle, LUBRIVAL delivers oil to manifolded measuring valves which feed it under pressure to the bearings. Lubricant is force-fed by positive piston displacement. Flow can be regulated over a range of 10 ounces to one gallon per minute. Valves have individual sight indicators and offer a degree of installation and operational flexibility previously unknown in such devices.

The Farval representative near you will give you all details. Or write for Bulletin 70. The Farval Corporation, 3287 East 80th Street, Cleveland 4, Ohio.

*Affiliate of The Cleveland Worm & Gear Company, Industrial Worm Gearing.
In Canada: Peacock Brothers Limited.*

KEYS TO ADEQUATE LUBRICATION—
Wherever you see the familiar Dualine valve manifolds, dual lubricant lines and central pumping station, you know a machine is being properly lubricated. Farval manually operated and automatic systems protect millions of bearings.

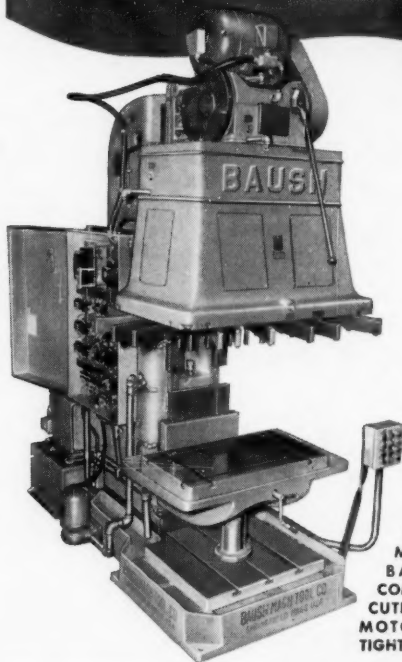

Choice of the Leaders

CUTLER-HAMMER

MOTOR CONTROL

C-H

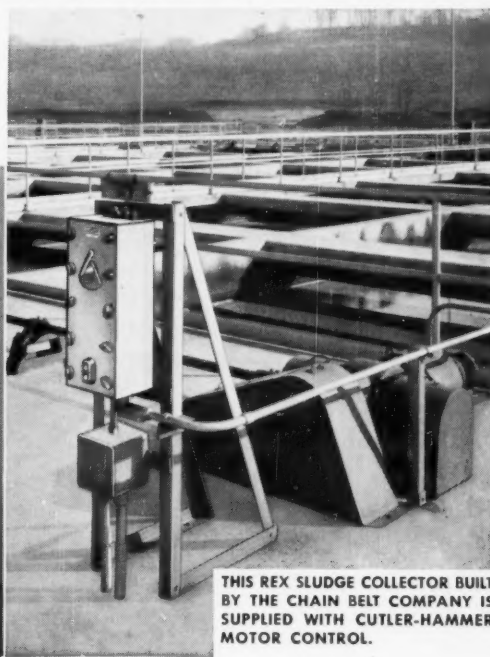

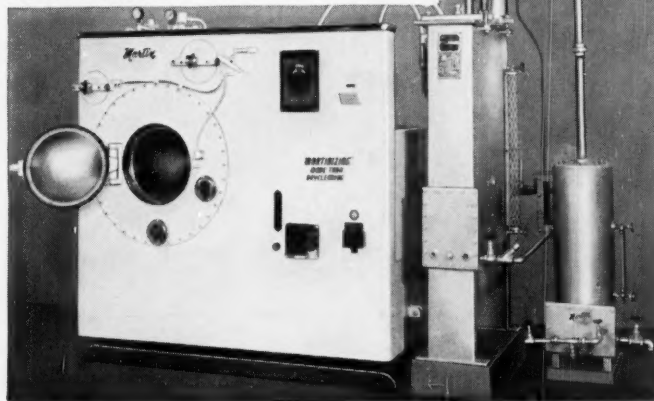

The Mark of Better Machines

THE SEYBOLD 100" FULL-HYDRAULIC MILL SPACER TRIMMER MANUFACTURED BY THE HARRIS-SEYBOLD COMPANY IS EQUIPPED WITH CUTLER-HAMMER THREE-STAR MOTOR CONTROL AS ORIGINAL CONTROL EQUIPMENT.

W6 VERTICAL SPINDLE DRILLING AND TAPPING MACHINE BUILT BY THE BAUSH MACHINE TOOL COMPANY IS EQUIPPED WITH CUTLER-HAMMER THREE-STAR MOTOR CONTROL AND OIL-TIGHT PUSHBUTTONS.

THE AMERICAN LAUNDRY MACHINERY CO. USES CUTLER-HAMMER THREE-STAR MOTOR CONTROL AS ORIGINAL EQUIPMENT FOR THEIR MARTIN DRY CLEANING MACHINES.

THIS REX SLUDGE COLLECTOR BUILT BY THE CHAIN BELT COMPANY IS SUPPLIED WITH CUTLER-HAMMER MOTOR CONTROL.

Look to the Stars for Satisfaction

Motor control equipment plays an important part in the performance and dependability of modern machines. None know this better than the machinery builders who have won positions of leadership. Only superior performance can create such reputations.

Experienced machine buyers know this is true and they look to motor control as a guide in making their selections. They know Cutler-Hammer Three-Star Motor Control does much more than provide

assurance the electrical equipment is trustworthy. They know it reveals the standard to which machines are designed and built.

When you buy machinery, note how often Cutler-Hammer Three-Star Motor Control is not only offered but featured by leading machinery builders. Look to the Stars for satisfaction. CUTLER-HAMMER, Inc., 1310 St. Paul Avenue, Milwaukee 1, Wisconsin. Associate: Canadian Cutler-Hammer, Ltd., Toronto.
